Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,
Publishers Mining and Scientific Press.

To Blacksmiths.

An excellent, strong lad, from the interior, 17 years of age, desires to learn the Blacksmith's trade. His parents wish him to engage with a reputable firm, and learn his business thoroughly. Address, or inquire at the office of the MINING AND SCIENTIFIC PRESS. 12v1tf

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $25. The caveator fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $30 to $40. If the patent is granted no further agency expenses cnaues. If the application is rejected we a cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our clients.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inveutor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented at the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the date of their application in the Patent Office, as it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 years and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertisiug than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

POSTPONEMENTS.—We would again call the attention of Secretaries to a certain point of the miniug law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

The Silver Mines of Nevada.

Mr. Bowles, of the Springfield (Mass.) *Republican*, in a recent letter describes the silver mining region of Nevada, first speaking of the vicinity of Austin, the easternmost of the mining towns in our State. He says:

OF THE REESE RIVER MINES.

All up the Austin hillsides, among the houses, and beyond them, are the big ant hills that denote mines or the hopes of such. Down in the valley are the mills for crushing and separating the ore. Back and around the corners, and over the mountains for many miles, are similar though less frequent signs. The main Austin belt, however, has been successfully traced for but five miles, and one in width. The veins of ore lie thick in the rotten granite of the hills, like the spread fingers of some mineral giant. They are small, sometimes as inches, rarely widening to more than three or four feet. But to compensate for this disadvantage, they are exceedingly rich and generally reliable. About fifty veins are now being worked, successfully, and as many more have been satisfactorily prospected, and are being put in condition for operation, or are now awaiting the coming of capital and its machinery. Water flows into all the veins freely, and much labor is required to pump it out. But few of the mines have mills connected with them; several of the older and strong companies only combine both operations, and make the two profits.

The mills are located with regard to wood and water, rather than to the ore, and the latter is carried sometimes for miles to be worked. Half a dozen mills, working some 75 stamps in all, are already put up in the Austin and neighboring cañons; but only about 50 stamps are now at work. The number will be speedily doubled by mills going up or in repair. The ore yields from $100 to $400 in silver and gold per ton; but at present prices it costs nearly or quite $100 to mine and work it, so that that which yields only $100 cannot be profitably worked. Consequently, miners who have no mills, separate their ores, and hire worked out only the most valuable, saving the rest up until competition brings down the price of milling, or they erect mills of their own. The charge for working the ores at the mill is $80 per ton, about half of which is profit. The same work can be hired done at Virginia for $40 and $50. The ore of one mine near Austin has averaged $180 per ton for many months, and yields a net profit of at least $100 a ton to its owners. Another company, owning both mill and mines finds its ores yielding $150 a ton without assorting, and the cost of getting out and working is but $50; so that working six tons a day, their steady profits are $600 daily, on an expenditure, in investments, of less than $200,000, and the employment of about 30 men.

New York companies are now coming in here and putting up fine new establishments. One hundred thousand dollars will pay for a fine large mill with 15 to 20 stamps. Promising prospected mines can be bought for from $10,000 to $100,000. It is not advisable for new enterprises to erect mills: first, because there will probably be soon enough in the region to supply present wants at a fair price; and second, because so soon as cheaper and more speedy communication can be obtained, the ores will be transferred to other places, where fuel and water are more abundant for milling. Even now, with freight 10 to 12c. a pound, from Austin to San Francisco, all the ore from one mine in Austin is sent to England to be worked. New discoveries of valuable ore are constantly being made both in the immediate neighborhood of Austin, and far south and north on the same range of mountains. In both directions veins equally rich and much larger have been found; and many parties are busy prospecting. Scattered mills are also in operation in these remote localities; and many a mining village is struggling for notoriety among the Humboldt mountains to the northwest. But Austin is the chief point of mining population and development in central Nevada, as Virginia in the Western.

THE MINES ABOUT VIRGINIA CITY.

But Virginia presents many contrasts to Austin. It is three or four years older; it puts its gambling behind an extra door; it is beginning to recognize the Sabbath, has many churches open, and closes part of its stores on that day, and has a thrifty and enterprising air, and contains a population of 10,000, besides the adjoining town or extension of Gold Hill, which has about 3,000 more. Different, too, in its mines is Virginia and Austin. Instead of numerous little veins, the wealth of Virginia lies in one grand ledge of ore, running along the mountain side, just within the upper limit of the town, for three miles; of width, from fifty to one hundred feet, and of depth incalculable. This is the famous Comstock Ledge, and no silver mines worth working have yet been found off from it, in the neighborhood of Virginia; though thousands of dollars and years of labor have been spent in the search. Nor has the working of this ledge at its various points been at all attended with uniform success. At least as many companies have failed upon it as have succeeded. Only 14 out of 30 companies formed and still at work upon the Comstock ledge have paid dividends. One company has spent over a million dollars in the vain pursuit of "pay ore;" the vein it has, the ore it finds, but not rich enough to pay for milling.

The success of other companies has been more marked even than these failures, though they be fewer in number. The Gould & Curry is the largest and most famous enterprise here. It has 1,200 feet on the surface of the ledge, has dug down 600 to 800 feet in depth, and back and forth on its line twenty or thirty times; its whole excavations are five millions of cubic feet, and affording some 200 miles of underground travel, and consuming more lumber to brace up the walls than the entire city of Virginia above the ground has used for all its buildings, with the largest and finest mill probably in the world, costing nearly a million of dollars and running 80 stamps. This mammoth enterprise has only drawn $180,000 from its stockholders, and has paid them back four millions in dividends. Altogether it has produced twelve millions of bullion, and but for extravagance in management and the necessity for many a blind and expensive experiment, its profit share would have been at least 50, instead of 33, per cent. In one year its yield was four and a half millions, and its profits one million; but with a railroad to San Francisco, it would have swollen its net to the owners to three millions!

At one time the mine sold at the rate of $6,000 a foot, but now it is down to about $1,800; for though it is making bullion at the rate of two millions a year, and pays handsome monthly dividends uninterruptedly, it has about exhausted all the valuable ore in its mine at the present depth, and is working up mainly the poorer ore that it rejected in its first progress through the mine. The Ophir company is another of the mammoth enterprises. That, too, has taken out twelve millions of bullion, but the stockholders have not got much as their share, in consequence of extravagant and fickle management, and experiments that proved expensive failures. The Savage company, owning another large and successful mine, has taken out six millions bullion.

That part of the ledge lying in Gold Hill is divided up into smaller properties, such as 100 and 200 feet, and one as low as ten feet, measuring the surface; and these have been worked generally to better advantage than the sections in Virginia. The Empire Company's claim has sold as high as $18,000 per foot, the highest price ever obtained by any mine here; but it has grown less profitable and interrupted in its dividends since, and has fallen to from $3,000 to $4,000 per foot. This company never took any money from its stockholders, and in only one month through its operations of some years has it failed to pay expenses. Another successful and popular company in Gold Hill is the Yellow Jacket, which has taken out about $2,000,000 of bullion, and paid its stockholders about $330,000, or $35,000 more than all their assessments. But among its heavy expenditures, which suggests the ruin of many of these mining companies, is an item of $270,000 for "legal services and quieting title."

The Comstock ledge ore is, with small exceptions, much more simple in its combinations than that at Austin, and requires only to be crushed and amalgamated to extract the bullion. These two processes will produce from 60 to 80 per cent. of all the precious metal. It is also less rich than the Austin ore; $50 is a good average per ton, and is about what the Gould & Curry claims for what it makes of its own ore. But the average of all the mines is even less than that. One mine reports an average yield for the year of only $30.26 per ton; and the product of the whole ledge for the first three months of the present year is given to me as about 100,000 tons, yielding nearly a $1,000,000, and averaging a fraction less than $40. To meet this lower yield per ton, however, is a greatly decreased cost of working the ore, which does not need the roasting or smelting process, and the whole expense of mining and reducing, which does not exceed $25 per ton, is reduced to $18 and $20 by the Gould & Curry company. The probability is, that even this cost may be much reduced, and that ore that does not yield $10 and $15 to the ton can soon be worked with profit. A choice selection of the Gould & Curry ore, such as promises $1,000 a ton or over—for there are streaks of such in all the mines—is sent to Swansea, Wales, for working. This amounts to say 50 tons a year. A next lower quality, which will yield $200 or $300 a ton, and amounts to some 50 or 60 tons a month, is sent over into the neighboring valley of Washoe to be treated by the Freibourg process, which includes the roasting, and is the same as is necessary for all the Reese River ores. The balance or bulk of the product is treated at their own mill, which disposes of about 100 tons a day, or, if there is an excess, as there often is, at some neighboring custom mills.

MILLS AND COMPANIES.

There are, in all, seventy-seven quartz mills working on ore from the Comstock ledge, 22 of which are connected with mines, and 55 are custom mills. They are located in four different counties, only about half being in the same county with the mines whose ores they crush. Fifty-four of them are run by steam, twelve by water and eleven by water and steam combined. They have in all 1,019 stamps, and their capacity is 1842 tons daily, which is only about two-thirds employed now. The mines have been running down in daily production from 1,640 tons last October to 1,000 tons in June, but are now increasing again, and if the present search for paying ore at lower depths in the leading mines is realized, it will speedily go up to a higher point than it ever before reached. The present product of the whole State is probably nearly twenty millions a year, of which Austin is sending forward a million and a quarter, and Virginia and Gold Hill fifteen to sixteen millions. Though the bullion, as perfected here, looks like pure silver, nearly or quite one-third of it in value is really gold; and this is extracted after it gets to market in England, or by the United States mints in the East. During the great excitement of 1862, when the Austin mines were discovered, and the Comstock ledge was doing its best, there was a wild speculation in mining properties, and many bogus or wildcat claims were bought and sold, and numerous companies organized that never did any business.

Some statistics before me give 700 as the number of companies incorporated to operate on the Comstock ledge alone; but of these but one hundred had prospected mines, and only fourteen have operated so successfully as to pay dividends. Most of the capital invested in the Nevada mines so far has been Californian. Eastern capital and Eastern men are now coming hither in force, and promise soon to start up anew the rather dormant life of the State, and give rapid and profitable development to its great mining wealth. One small circle of New York capitalists have already invested about two millions dollars in mill and mines here and in Austin, and by the help of a liberal faith and the employment of first-class agents, are doing well in all their enterprises.

CONCLUSIONS AND ADVICE.

The mines of the Reese River district (Austin, etc.) though of narrow veins, offer the most promising field for new enterprises. They are richer, and seem to be more certain to hold out than those of the Comstock ledge; though in the matter of continuance they need yet further testing.

Beginners in the business should not be in haste to buy or erect mills. There is a superabundance to-day of that sort of property on the Pacific coast. Those at Virginia and its neighborhood are not worth what they cost (six millions) by at least 25 or thirty per cent., and the engines can probably be bought cheaper on this coast than they can be bought in New York and shipped around or across the mountains.

Foremen of mills and mines, first promoted from pick and shovel, are good material for such positions, and are gaining them. The miners, as a class, are of a higher grade than Eastern laborers, and they offer many cases fit for the upper places in business. I was impressed with the wisdom of an organization which a party of Rhode Island capitalists had made in Colorado. They combined four or five different mines and mills, each distinct in its affairs, under the general management or overseership of an experienced, scientific miner from California, and sent along with him from home a common treasurer and accountant. In this way they got the benefit of the best talent and experience, and the most reliable guardianship over the expenditures, without making the cost thereof too heavy.

Do not make the capital of your mining company out of all proportion to the cost of the enterprise. Avoid putting up a property that has cost $100,000 and needs a working capital of as much more, to two millions, because you may hope sometime to pay a ten per cent. dividend on such a sum. And, then again, do not insist on having a dividend at the end of thirty days, unless you are ready to pay an assessment at the beginning thereof to meet it.

When somebody offers a mine, where ore assays $1,000 or $10,000 a ton, you need not necessarily dishelieve him, but do not necessarily conclude that all its ore, for an indefinite distance into the earth, is of equal value. The Comstock ledge was opened with a chunk that yielded $20,000 to $30,000 per ton, or at that rate; but the mines on that ledge that are paying at all, do not average $40 to their ore. Every day new discoveries are being made, south and north, in the State, of leads whose surface ore pays, according to report, any amount this side of $100,000 a ton; yet it does not follow that the mine below it will even pay for working.

And if you have neither time nor money enough nor disposition, perhaps, to go largely into these mining enterprises, and follow their management intelligently, but still would like to make some small ventures to fortune in this direction, seek out some company that are in or going into business, on these principles, and that have got a reasonably sure thing of it, and make your investment with them; and then be content with 25 per cent return from your money. If it yields more, give it away in charity.

How to Train Athletes.—The Yale boat clubs wrote to England last spring, and got from the secretary of the English University clubs the style and dimensions of the champion shells, from which a boat was constructed, but too late to allow the crew time to accustom themselves to it. An upset was feared, and one of McKay's best shells was substituted. The English boat was fifty-one feet long, twenty inches wide, and twelve inches deep. The Yale men rowed tolerably hard all this summer, and for a few weeks previous to the regatta put themselves upon rigid diet and exercise, rising at six o'clock and immediately taking a sharp walk, and a "spurt" of a run for five minutes. Being rubbed down, on return, with towels and hair gloves, they took a sponge bath, and breakfasted at eight o'clock upon chops and steaks, pilot bread, black tea, and fried potatoes. At tea o'clock they rowed four miles, and, after cooling, took a salt water bath. Dinner came at one o'clock, consisting of roast beef and roast mutton, but no vegetables save the potatoe; and this was succeeded by a second rowing essay of five miles, until five o'clock. At supper, at seven P. M., they took oatmeal porridge, soft boiled eggs, and black tea. This training is said to develop the muscular system to extraordinary hardness and size, and adds no adipose matter to the man.

Silver Discoveries continue to be made within the limits of California. The Calaveras *Chronicle* is informed by a gentleman from West Point that the "Star of Blue Mountain" company have, within the past few days, struck the lead in their tunnel at Blue Mountain, in this county. This company have been at work for two years, and now their persevering industry and energy are rewarded by one of the finest silver leads ever discovered west of the Sierra. Mining in this district was never in a more prosperous state than at present; the custom mills are all crowded. Numerous rich leads have been discovered in this district during the summer. John Johnson, an old resident of the district, discovered a lead in August last, from which he took three thousand dollars in six weeks, and afterward sold his lead to a Mr. Barnes, for one thousand dollars. Charles Goldstein discovered a lead last week, in the same locality, for which he has refused ten thousand dollars.

The Tule Lands.—Mr. Bryant, a practical civil engineer, who has devoted much time and thought to the subject of irrigation and to the reclamation of the tule lands of the State, has just returned to Stockton from a fortnight's reconnoissance of the swamp lands between that city and Monte Diablo. His opinion is that if the yearly autumnal fires which sweep away all the tule could be prevented by stringent laws, in a few years, by the accumulation of vegetable mold, from the decay of such heavy bodies of tule, the lands that are now scarcely above tide level at the lowest stage of water, would be raised several feet, rendering a system of drainage perfectly practicable, and greatly improving the quality of the soil. He arrives at this conclusion from the fact that immediately on the river and slough banks, where the water and brambles protect the tule from the annual fires, the ground is several feet higher than further back, while the quality of the soil is infinitely better.

How to Select Flour.—First, look at the color; if it is white, with a slight yellowish or straw-colored tint, buy it. If it is very white, with a bluish cast, or with white specks in it, refuse it. Second, examine its adhesiveness; wet and knead a little of it between your fingers; if it works soft and sticky it is poor. Third, throw a little lump of dry flour against a dry, smooth, perpendicular surface; if it falls like powder it is bad. Fourth, squeeze some of the flour between your hands; if it retains the shape given by the pressure, that, too, is a good sign. Flour that will stand all these tests, it is safe to buy. These modes are given by old flour dealers, and they pertain to a matter that concerns everybody—the staff of life. *Genesee Farmer.*

Twenty-four years ago the United States produced only 6,000 bales of hops. The yield of 1863 was estimated at 65,000 bales, while that of 1864 is stated at 45,000 bales.

A lead mine, which promises to be very productive, has recently been discovered in Richmond, Me.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Oct. 14, 1865.

MINING INVESTMENTS.

California is not the only portion of the mining world where there has been a fearful amount of waste organizations. A gentleman well acquainted with the Lake Superior copper region and whose experience enables him to speak reliably, says:

By an examination of the records of the country, and from other sources, I find that, since the year 1845 there have been organized no less than three hundred companies, for the purpose of working Lake Superior lands. Many of these have been here, as in other mining sections, out and out swindles, started to profit nobody but the originators, and this, too, not from any mining work, but from the revenue from the sale of the property and the fictitious value given to stock by sensation reports and willful lies. Of these three hundred concerns only about 19 per cent. have ever shipped ores, and but three, or 1 per cent., have declared and paid dividends. About twenty-six are at present in operation, and many of these are upheld not by the proceeds of the ore sold, but by direct calls on the stockholders, made by the levying of assessments. Of these numerous organizations some were formed to work on explored lands, and others—and the majority, too—on grounds into which the explorer's pick had never been struck, but on suppositious value only, because geologists had pronounced them 'copper lands,' with a wonderful oblivion that 'Lake Superior copper lands,' to use the words of a friend whose knowledge of the country is extensive and thorough, 'have no more value than agricultural lands in similar situations, until after they have been shown to contain copper.' Some have been organized to work on 160 acres of such land, some on 80, some even on 50, and not a few *on paper*."

Another Eastern writer, not at all discouraged by such statements as the above and similar ones which reach the Atlantic States from California, very forcibly advocates mining, not only for the baser metals, but for the precious metals as well, as a legitimate and profitable investment for business men. He says: The question is often asked "Can money be safely and profitably invested in gold and silver mines?" He unhesitatingly answers "yes—with as much certainty of return as one dollar can be paid for another, and with more certainty of large increase than in any other business." Not, however, he proceeds to say in substance, by buying anything and everything which may be called a gold, silver or copper bearing lode; nor by merely *supposing* you have a rich mine, and upon that supposition, with little or no evidence corroboratory of the supposed fact, investing thirty or forty thousand dollars in machinery, to find in the end—nothing that will pay. Such a course ignores common sense and common prudence, opens the door for various kinds of swindling on the part of designing men, and exerts a most disastrous influence upon all legitimate mining operations. The writer proceeds to recommend the observance of nothing but the simplest rules of business, as an almost sure guarantee of success. Know, says he, what you buy either from personal knowledge or by your experienced agent in whom you have confidence. Then withhold all expenditure for machinery until the claim is developed, and its working value ascertained, either before or after purchase. In this way companies can secure, by the aid of competent, practical and experienced miners, as good claims as have been found, anywhere, such as will yield a fair percentage, say five per cent. a month on a thousand feet to the company, at one thousand dollars per foot. An experienced miner, competent to test ores, can never be mistaken as to the value of a ledge from surface indications—the almost invariable rule being, "if rich on the surface, richer below."

THE BUNKER HILL COPPER MINE.—Active work is now in progress upon this mine, located in El Dorado county, with the view of its thorough development. The center or main shaft is now about seventy-five feet deep, being driven on the incline of the vein. The lode is some three feet in thickness, and is highly impregnated with green carbonate of copper. The hoisting is now done with a horse whim, which it is thought will be sufficient until a depth of 100 feet is reached. Drifts have been run each way, a distance of about seventy-five feet from the shaft. Upwards of forty tons of No. 1 ore have been raised, which it is claimed will assay from 17 to 18 per cent. of copper; also about the same quantity of second-class ore, which will average about eight per cent. A second shaft has been sunk 150 feet north, to a depth of forty-five feet. This will be connected with the main shaft at the depth of sixty-four feet. A third shaft has been put down to the same depth, about 300 feet south, which will also be connected with the other two. All the work is done in a substantial manner, and it is well timbered. It is confidently expected that the Bunker Hill will prove a valuable and model mine. It is freely opened to visitors who may wish, through motives of curiosity or profit, to examine it. The stock is owned mainly in San Francisco, and the work is done under the immediate supervision of Mr. R. Powning, the local superintendent, from whom we gather the above information with regard to the same. By reference to advertisement in another column, it will be observed that "able-bodied miners" are wanted at this mine.

MINING ACCIDENT—ANOTHER WARNING.—An accident of a somewhat rare occurrence took place a few days since at the Ophir-Mexican shaft. It appears that a cage, upon which two men were descending, caught upon the guides and stuck till about twenty feet of slack cable had run out, when the cage came loose and fell as far as the slack cable would let it, jarring the two men upon it considerably, and spraining the ankle of one of them. It was fortunate that the cage fell no farther than it did, as a very little increase of distance must have resulted fatally. The Virginia *Enterprise*, in noticing the accident, very properly remarks that "no cages should be allowed to be used except safety cages, in any shaft in the State. They cost but little more than the old style, and what is the cost any how, compared to human life and limb. There is a new and splendid safety cage now in use in another compartment of this same shaft, and there should be one in the place of this old one." It is certainly singular that the managers of any of our extensive mining works will still persist in neglecting to take ordinary precaution to protect the lives and limbs of their employees.

UTAH MINES.—Captain Geo. F. Price, A. A. Adjutant General on Gen. Conner's Staff, informs the Union *Vedette* that a New York company, with a cash capital of $100,000, has been organized for investment in the Utah mines.

THE WOOL PRODUCT—Thus far, this year, 9,832 bales of wool have been shipped from this State.

CHEAP RAILROADS FOR THE MINES.

There is said to be a narrow guage railroad, which has been in operation for over thirty years in one of the English mining districts, and which has been attended with great success. The road is but two feet guage, and up to last accounts four engines had run fifty-seven thousand miles over it without once starting from the rail. It has been held that a railroad of less than four feet eight inches guage would be unsafe, but experience shows that on a railroad less than half this guage there has been an entire exemption from accident. On the road described, a single train takes on an average fifty tons of goods and one hundred passengers. Following the English example, the people of Norway have fifty-four miles of the narrow guage railroad in operation, and so well pleased are they with the success of the experiment, that a number of other lines are in course of construction.

We refer to the success of these experiments for the reason that the system seems well adapted to the mountainous portions of this coast. The subject is already in agitation in Oregon, with a view to the development of the Columbia river trade. The important mineral discoveries in Montana and other portions upon and near the upper waters of the Columbia river, render it a matter of the first importance that some cheap mode of transportation should be devised to connect those regions with the coast. To accomplish this, a general introduction of small steamers on the upper rivers is suggested, to be connected with tide water by portages whenever necessary. The portages in some instances will be but a mile or two, in others a greater land carriage will be required. The cost of grading a road of this description is less by one-half than that of the ordinary guage of railroad, while the cost for ballast and much other material is also proportionately decreased.

The same arguments which are employed by our friends at the North, are even more applicable to the mining regions of our own State and Nevada. Roads of this description can be built, and made to pay as an investment, in districts which would not warrant the construction of roads of the ordinary width. Would it not be well to institute more particular inquiry in this direction, with the view of initiating a railroad system such as is here alluded to, with the view of connecting our more important mining sections with the proposed and already existing main lines of railroad throughout the Pacific coast? By such a system a large value may be given to many of our copper mines, which are now scarcely worth working on account of the high cost of transportation to and from the great lines of travel connected with the principal centres of business, and additional value given to others whose locality and richness even now renders their working a matter of profit. We throw out these suggestions, hoping they may meet the eye of some one who may either turn them to profitable account, or show some good reason why the project cannot be made practicable.

"WOOD FOR ANOTHER DAY."—Under the above heading the Humboldt *Register* urges the ranchmen in that vicinity to turn their attention to the culture of trees of rapid growth, for the purpose of furnishing fuel and timbers for mining purposes, when the scanty indigenous growth of the country shall have been exhausted. The suggestion is applicable to all sections of this State, and should receive more than a passing notice from those engaged in agricultural pursuits. The *Register* says:

There is nothing in nature to prevent people living in this county from securing a home growth of firewood and small timbers, fit for use in four years from this time. Teams coming out with groceries for the winter's use, can as well bring some sacks of peach pits, and some parcels of locusts seeds. These two varieties of trees grow rapidly, and will thrive well in this soil. We hope gardeners, and ranchmen, anyhow, will give the matter their attention. We ought all to have some care for times no further than four years off. Town lots can be beautified, and the aspect of the country greatly improved.

A PATENT WELL.

A patent well is among the new inventions recently brought into practical use at the East. The process is so extremely simple, and, according to report, so effectual that it would seem as though it must soon come into general use. An iron tube is driven straight into the ground, just as one would drive a stake, and on reaching a depth at which any well would find water, a pump is attached to the end of the tube remaining above ground, and up comes the water. Of course it is applicable only to soil free from rock and boulders; as it is in such soil only that an instrument of that kind could be driven to the required depth. The principle is obvious. By working the pump in that portion of the tube above ground a vacuum is formed in the sand and gravel between the pump valve and the bottom of the tube, upon which the water flows; proving, moreover, that the atmospheric pressure is as continuous down through the pores of the earth until it reaches the water-level, as it is upon the water-surface above ground. The principle is an old one, and has been practiced in many parts of Africa and Western Asia from time immemorial. The natives of those regions, where water is found near the surface, but where the sandy character will not allow of its standing on the surface, are in the habit of digging little pits until they reach a moist point, when a number of rushes are inserted and the sand carefully packed around them until the excavation is filled to the hight of the bunch of rushes, when the mouth is applied and by vigorous suction sufficient moisture is obtained to quench thirst—thus affording another illustration of the oft-repeated and generally true saying, that there's nothing new under the sun. We understand that some experiments with the tube have been made in the vicinity of Stockton, in this State, but with what success we are not informed.

THE ORIGINAL SHAFT.—It is said that ores from which have been taken fully seven millions of treasure have been raised from one shaft in the Ophir mine. This is, moreover, the identical shaft which was commenced upon the very spot where was made the first discovery of that vast source of wealth which has since given the Comstock vein a reputation excelled by no other throughout the earth. Since its discovery a little over half a decade has passed away; yet, in that time, more extensive and more difficult labor has been expended in exploring the depths of that vein, and extracting therefrom its vast riches, than have been required in building and beautifying some of the finest cities on the globe.

NATURAL YEAST POWDERS.—There is found in a lagoon, a short distance from La Paz, on the California side of the Colorado river, a somewhat curious mineral compound, said to be a crystalized combination of salt and soda, which possesses the useful property of raising bread as well as the manufactured article employed for that purpose. It is also claimed to be still more valuable, from the fact that, when mixed with lime, it makes an excellent flux for smelting the copper and silver ores, which are very abundant in that region.

A FOOLISH PRACTICE.—The system of publishing the income returns of private persons, as obtained from the internal revenue offices, as practiced in this country, is much ridiculed and denounced among business men in Europe. The journals there cannot see how our people will submit to such an impertinent prying into persons private affairs, by newspaper reporters. The London *Spectator* says that even the absolute government of India failed to enforce such a system—the merchants declaring that they would submit to imprisonment sooner than allow it.

COPPER SHIPMENTS.—There are now five vessels in this harbor taking in California copper ore for Atlantic ports and Swansea, England. These vessels are loading almost exclusively with ore—a significant indication of the rapidly increasing importance of our copper interests.

NO LOSS OF CONFIDENCE.

The fact that our city has stood so firmly under the greatest earthquake shock of which we have any record in this locality, is a matter of just congratulation to our citizens, and will do much to establish confidence in the future. Save the single casualty to the new building on Third street, which was yet green, and not properly secured, none of the frail high buildings throughout the city have suffered fatal damage. Not one of the numerous tall steeples or solid edifices constructed within the past three or four years, have been injured. All the houses fractured are inferior structures, or built upon made land, and consequently unstable foundations. People have gained instead of lost confidence in the capacity of thorough built brick houses to endure earthquake shocks, since witnessing the manner in which those in this city have withstood the last severe test.

The chimney, which it was reported "fell down" at the Lick House, was the mere toppling off of a few bricks from the top of a temporary flue which passed up outside of the wall in the center area. This chimney, frail and temporary as it was, did not fall. We called at the House a few days since and was kindly shown through the same by Mr. Alstrom; the only damage it sustained, beyond that spoken of, was a few slight cracks in the plastering in two or three of the rooms. We would take this occasion to allude to the Lick House as a perfect model of a structure to be built in a country subject to earthquake visitations. The house is only three stories high, and is so firmly bound and anchored with iron ties, passing from wall to wall, as to be absolutely proof against any serious damage from earthquakes, except such as might open the ground and swallow up all superincumbent structures. The Lick House was designed by an old pioneer who was well acquainted with the effects of earthquakes, and who built this house with especial reference to combining every possible security against such casualties.

GOLD MINING IN AUSTRALIA.—The Koh-i-Noor gold mining company, at Ballarat, Australia, took out $132,000 for the quarter ending with the 31st of March last. The cost of mining and crushing this rock, with current repairs of mill and mining machinery, was $18,300, leaving the sum of $114,000 as the profits of the plant and mine for three months, or $456,000 a year. The total amount of wages paid is $2,855 per week, averaging $11 74 per man. The head manager receives a salary of $19.36 per week; the head engineer, $18.15; amalgamators, $10.89 each; mining captains (underground) $12.70; ordinary underground miners, $10.89 each.

ANALYSIS OF OYSTER WATER.—M. Pagen, a French chemist, has analyzed the water of oysters, which is about equal in weight with the flesh. He states that it is not simply sea water, as it contains less salt and more organic matter. Agitated with ether it deposits a substance analagous to albumin, containing 8.75 per cent. of nitrogen. The liquid, when analyzed, gave 95·888 water, 3.022 salts, 0.560 nitrogenous matters, and 0.529 non-nitrogenous matters. M. Payen considers that the water of the oyster is important in its alimentation.

MAP OF AUSTIN.—We learn from the Reese River *Revielle*, that Gen. Rosecrans, who is now sojourning at Austin, and who is largely interested in mining property there, proposes to undertake the execution of a map of that district, on which will be shown the name of every ledge or claim thereon, with their exact boundaries, and the direction and degree of inclination of the foot wall to the horizon. This map will prove of great benefit to the holders of claims in the locality, and will be found particularly interesting to those in the Atlantic States who have invested in that locality.

BULLION SHIPMENT FROM AUSTIN.—The bullion shipment from Austin, Reese River, according to the *Revielle*, was $49,549 for the month of September.

THE SALE OF THE RAWHIDE RANCH MINE.

In common with others of our cotemporaries, we have given currency to the sale, to San Francisco parties, of the Rawhide Ranch mine for the sum of $75,000. We understand that a lawsuit is likely to grow out of this transaction, the facts in connection with which have been furnished us as follows, by Messrs. M. G. Elmore & Co., of this city:

It appears that in June, 1865, parties in this city took this mine, with the extension called the Keegan, and the ranch of some 400 acres, to the Eastern market for sale; taking deeds of the whole properties in name of D. W. Barney, President of Wells, Fargo & Co., with instructions from the owners to him to transfer the title to the order of Messrs. Elmore & Co., upon receiving in order, as mentioned above, the sums of $50,000, $10,000, and $5,000, in U. S. gold coin, the deeds being properly recorded at Sonora; and on the 16th of September the parties mentioned sold the properties in New York. In the meantime, the Rawhide mine proper had much improved, and excited the cupidity of certain other parties in this city, who offered the owners of the mine $75,000 for the same. On the 30th day of September the money was telegraphed from New York to Wells, Fargo & Co., to pay for the properties—$65,000—and tendered to the owners on that day; but refused by them.

On the 3d of October the owners of the Rawhide mine made the transfer to these San Francisco parties over the deed mentioned, and put them in possession. As might be expected, the transaction involves a lawsuit for possession, and which, we understand, will be immediately instituted by the New York parties.

The mine is computed by good judges to be worth at this time half a million of dollars.

Taking the above to be a correct statement of facts, such transactions are to be greatly regretted, as they bring discredit on the State at the East, and must hinder, to a certain extent, Eastern capitalists from investing here. Every mine of this description, sold there as no. A 1 mine, is a great help to us as a State.

Since the above was in type, we have been informed that Wells, Fargo & Co. have paid for the Keegan $10,000, and for the ranch $5,000, and taken possesssion of the same, leaving the Rawhide Ranch mine for litigation.

TERRIBLE STEAMBOAT EXPLOSION.

The steamer "Yosemite," running between this city and Sacramento, burst her starboard boiler just as she was backing out from the Rio Vista wharf, a few minutes past six o'clock on Thursday evening. The saloon cabin, upper forward works, and everything forward of the smoke stack, are a complete wreck. All the wounded who could be got off when the Chrysopolis passed up, were taken to Sacramento. The number of wounded taken up was thirty. Five were known to be killed. The accident is attributed to the keeling over of the boat, by the passengers rushing to one side as she was leaving the wharf. The Yosemite was one of the finest boats on the inland waters of the Pacific. She was a low pressure boat; and presents the first instance of the bursting of a low pressure boiler on this coast. The scene of the explosion is described as having been terrible in the extreme. The Navigation Company have sent up a steam-tug to bring her down if afloat. It was thought at the time the Chrysopolis passed up that there were quite a number of persons still buried beneath the *debris* of the wreck, some of whom may yet be got out alive. We shall have more full particulars by the down boat to-night.

RAISING SUNKEN VESSELS.—Mr. Joseph De Vinney, at the N. E. Corner of Washington and Drumm streets, has been appointed agent for Austin Z. Page's new patent method of raising sunken vessels.

THE *Oregonian* says that Marion Moore & Co., of Owyhee, have a mill on the way for that Territory. It arrived in Portland on the 21st ult., per steamer Orizaba.

Mining Summary.

CALIFORNIA.

The most extraordinary success which has attended quartz mining in Nevada county and some other sections of California, is evidently having an important influence in convincing business men and capitalists throughout the State, and in this city in particular, that the quartz mines on the western slope of the Sierras, present most favorable inducements for the employment of enterprise and capital. A very large proportion of the late mining sales, it will be noticed, have been made to San Francisco capitalists, who, as a general thing, are buying for permanent investment, satisfied that with proper management gold mining in California can be made to pay. Perhaps the fact, which is furthermore being especially brought to their notice, that the mercantile and agricultural interests of the State can only be sustained by a proper development of our mines, is also exerting an important influence in the same direction. These facts are among the most noticeable and encouraging signs of the times, and betoken a more prosperous and permanent future than has yet been realized in connection with the general industrial interests of the State.

SHASTA.—Whiskytown, in this county, which was thought to be nearly defunct, is now, according to the *Courier*, beginning to show signs of renewed improvement.

The Highland mill cleaned up again on the last of September $2,709, making, with their clean-up of the 11th ult., $6,108 for the month, running from four to eight hours per day, only, on account of the lack of water. With a full head of water they expect to take out $20,000 per month. The handsome sum of $20,000, it is said, was recently offered and refused for a fifth interest in this claim.

The Spring Creek mill company are now going down on their ledge, and prospecting their rock with a hand mortar, which indicates a pay of $50 per ton. They have about 100 tons out.

The Jollie mill are experiencing considerable trouble in working their rock, on account of the difficulty of extracting the gold from the sulphurets. They expect to be obliged to subject them to chemical treatment or to a fire process.

YUBA.—The *Appeal* learns that five shares of Jefferson stock have changed hands at $180 per share; and adds: "It is gratifying to see that this claim is more and more appreciated, but we are at a loss to understand why Pennsylvania stock is still so much neglected, it now being almost a certain fact that this rich pay streak is crossing the one claim as well as the other. Three hundred shares of Pennsylvania stock have been sold this week at less than $10 per share."

PLUMAS.—The late rains have raised the streams considerably in this county; so much so, that in some localities the miners were driven out of their claims. According to the Quincy *Union*, Messrs. Truck & Waterworth have purchased the Buckeye quartz mill, and will commence crushing quartz from their ledge in a short time.

A gold bearing quartz ledge has recently been discovered in Cherokee District, [Round Valley] near the "Kettle Ledge." Some of the rock was crushed in one of the mills at Round Valley, and paid $25 to the ton—*Union*.

NEVADA.—We have nothing of especial interest, this week, from Nevada, beyond the striking of several new ledges, which have not as yet been opened to a sufficient extent to develop their value. Reports, generally favorable, continue to come in from the Summit mines. The Enterprise company have made arrangements with Goss & Lamhard, the well known Sacramento foundrymen, for the erection of a first class mill on their claim. The company furnish the ore to parties putting up the mill, on their dump, and receive a certain share of the bullion extracted. One of King's patent desulphurizers has been shipped from from San Francisco for the mine, and the other machinery will at once be forwarded from Sacramento. It is intended to have the mill running in six weeks.

TUOLUMNE.—We extract the following mining items from the Sonora *Democrat*:

A lot of quartz from the Mount Vernon mine is now being crushed at one of the mountain mills, which is expected to yield largely. Some two tons of ore from the same lead, worked simply as a test, a month or so ago, paid over two hundred dollars per ton.

A gentleman from Big Oak Flat section says the quartz mines in that part of the county are looking up finely. In the vicinity of Deer Flat and the two Garotes several promising mines are being worked, and splendid rock is coming out.

CALAVERAS.—The San Andreas *Register* says William Irvine, of that place, has reopened his quartz mine at El Dorado with a favorable prospect of "pay." The Copperopolis *Courier* also speaks in high terms of the condition of quartz mining at Angels, where abandoned ledges are paying very well under the new process of extracting the gold. It is predicted that next year Angels will be one of the most prosperous and lively quartz mining towns in California.

WASHOE.

We devote a large space in our columns, today, to a very interesting letter from Mr. Bowles, editor of the Springfield (Mass.) *Republican*, descriptive of the mines about Virginia City and Reese River. This letter will be found well worthy of a perusal, and, in the main, correct. Our summary of news from these mines this week presents nothing of especial interest. We give such items as we have been able to glean from the local papers. The mills about Virginia City and Gold Hill (all that are in running order), appear to be quite busy, and at present there is no lack of ore for crushing.

The Yellow Jacket, under the efficient management of Mr. John B. Winters, says the *Enterprise*, is turning out large amounts of bullion. The first run of their new mill resulted in thirty-nine bars, valued at $74,000.

The Imperial Silver Mining Company have purchased of Messrs. Lindauer & Hirschman, the quartz mill and water-rights on the Carson river, at Dayton. This purchase was made on very favorable terms, and will not interfere with the regular dividends of the company, while it disposes of the litigation pending between the parties.

The Apple mine, according to the *Union*, is now yielding about seventy-five tons of ore per day of excellent quality. The claim is only ten feet in length, and lies between the Imperial and Alpha claims. Twenty-five tons of this ore, which will average $40 per ton, is being hoisted daily by means of a whim. Through the Imperial shaft twenty-five tons of still richer rock is daily taken. Twenty tons or more are also being daily run out through the Empire mine, from a depth of 600 feet to the new dump of the Apple mine on Main street.

The Bullion Company have made a very interesting, and which appears also to be a very valuable gold strike, in their lower drift, and about 150 feet from the south line of the Chollar claim. The gold appears in the hardest and whitest quartz found in the mine, though dark streaks of silver sulphurets are generally to be seen in the same rock, and not far from the gold. In some specimens the gold is so thickly sprinkled that it almost hides the quartz. As the company had not thought of looking for gold in their ore, the rock was thrown upon the dump, and the gold it contained passed unnoticed until the white clay, covering most of it, was washed off by the late rain, when a large number of specimens were picked up from the dump.

The Eclipse mill is receiving a general overhauling and renovation. The engine and boiler are being cleaned, repaired, and the entire machinery put in the most complete order. All will be completed and put in operation again on Saturday next (to-day).

The balance wheel connected with the big pump of the Bonner shaft bursted a few days since; a new one was put in its place the next day, and the pump set to work again as usual.

About ninety tons of ore are taken daily, at present, from the Ophir and Mexican, jointly. They have both a large quantity of water to contend with, which impedes their operations considerably.

REESE RIVER.

We have nothing of any especial interest this week from Reese River. According to the *Reville*, however, the mines are rapidly looking up. The William Bigler ledge is reported sold to New York capitalists at an enormous private sum. The ledge is said to be the largest in the district, being fifty feet thick.

The Silver Chamber, San Jose, and Mexican claims, all located on Union Hill, have been sold to parties in New York for $60,000.

SHOT IN.—Several workmen employed in a drift in the Latrobe tannel, at Virginia City, were completely shut in from their regular exit, a few days since, by a cave. Fortunately for the miners, however, they were enabled to find their way to the surface by another route, and came up through the shaft of the Central mine. The ground about the Comstock lead is so completely honeycombed with shafts and drifts that it is almost impossible for a person to get completely shut out from exit to the surface.

CALIFORNIA COAL OIL.—Two hundred barrels of coal oil were received on Tuesday last by Capt. Harrison, of this city, from San Buenaventura. The Lexington Well Co., near San Jose, shipped last week 120 gallons to New York, to show in that market the superior character of our California oil—they also shipped another hundred this week. Machinery for boring wells is constantly being sent out from this city in all directions.

SWEET AND SOUR.—Mr. Garvit had on exhibition at the county fair, apples which were sweet on one side and sour on the other. We do not remember to have ever heard of such a thing before. Garvit is a fruit wizard, and we should not be surprised to hear that he had produced something combining the qualities of a dozen or two different species of fruit.—*Mountain Democrat.*

Take a fruit bud from a sour apple tree and another from a sweet apple tree, cut them in halves, join the half of the sour to the half of sweet, and "bud" as usual. If carefully manipulated will it not grow; and if so what would be the character of the fruit?

TO MINE OWNERS.—A gentleman who has had much experience as a mining superintendent is desirous of securing a position as such in this State or Nevada. See advertisement in another column.

MAMMOTH FURNACE.—At the Dundyvan iron works, in Wales, an eliptical blast furnace has been erected, twenty by twelve feet in diameter and sixty feet high, which is said to give extraordinary results.

SPERM oil rose from $2 to $2 50 per gallon, in Boston on receipt of intelligence of the late piratical acts of the Shenaudoah in the Arctic Sea.

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR AND SEPARATOR,
Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; no trace of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest regularity of speed the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,
Novelty Iron Works, Fremont st., San Francisco,
15v11-3m Or to E. T. STEEN, Agent.

HENDY'S
IMPROVED BLOW-PIPE.
This Convenient Helpmeet
— TO THE —
ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

Traveling Agent.

MR. ROBERT LATTIMORE is now on a canvassing tour for the PRESS through Butte, Colusi, Tehama, Shasta, and Siskiyou counties, and we recommend him to the favorable consideration of our friends.

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINing Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.
San Francisco, Oct. 12, 1865. 15v11tf

Worth's Telegraph Reel.

MESSRS. DEWEY & CO.—Dear Sirs: I see a notice in your paper in regard to my Paper Reel, signed Henry McOann. All I have to say is, if I had invented such a Reel as his, in 1862 or 1863, and had not improved it more than he has, I would keep my name to myself, and not let the public know who I was. His notice puts me in mind of Shakspeare's play of "Much Ado About Nothing." My Reel is entirely different from his, and is considered, by operators who are judges of such things, to be the best; and as for the cord, I could rig one to my Reel that would run a week, but it is not necessary.

For the best Paper Reels, address
I. W. WORTH, Sonoma,
15v11tf Or, WM. LUNDBERG, San Francisco.

LICK HOUSE,
Corner of Montgomery and Sutter streets,
SAN FRANCISCO.
S. ALSTROM AND G. S. JOHNSON, Prop'rs.

This elegant and commodious Hotel is situated on the principal promenade street of San Francisco. The Lick House is finished and furnished with a degree of beauty and excellence unsurpassed, combining all the modern applications and arrangements of a FIRST CLASS HOTEL, thus offering superior inducements to the traveling public. The proprietors assure their patrons that the Lick House shall not be excelled in any of its appointments, or in polite attendance or attention to all the comforts of its guests.

MINING BLANKS
For Sale
AT THE
OFFICE OF THE MINING AND SCIENTIFIC PRESS,
No. 505 Clay Street, corner of Sansome.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186 , according to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]
Dated 186

Assessment Notice.

..... Company
....

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ....., 186 , an Assessment of .....per share was levied upon the Capital Stock of said Company, payable on the ..th day of .....186 , in United States gold and silver coin to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186 , will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186 , to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.
Office.....

NOTICE.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186 , the several amounts set opposite the names of the respective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophilus Thistle	23	14	$140 00
Peter Pipe	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ...., 186 , so many shares of each parcel of said stock as may be necessary, will be sold at the.....
....., on ....., the ..th day of....., 186 , at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.
Office.....

☞ Our advertisers are furnished with blank Assessment Sale notices free of charge. Orders from the interior promptly filled, by mail or express, as may be desired.

Monthly Series, containing 5 Nos	62½

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising

DEWEY & CO., Proprietors,
Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

Just and True Economy
IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by one HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete Index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

DEWEY & CO.,
4v11 Office Mining and Scientific Press.

QUARTZ OPERATOR'S
HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.
BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the crushing and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

New Volume
— OF THE —
Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).

PUBLISHED BY
DEWEY & CO.,
Patent Agents, Publishers and Job Print
505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

To work for wages (three dollars per day), or on contract.
10v11-tf RICHARD POWNING, Superintendent.

OIL SMELLERS.—A correspondent visiting the oil regions has come across this class of "indescribables." He tries to picture them and does it in this strain: "Did you ever see an 'oil smeller,' and can you tell to which of the three kingdoms it belongs? And would you think, from its name, that it has a soul to be saved? An oil smeller is a fellow who goes about, like the old water finders, with a fork of witch-hazel in hand, that obligingly points to six o'clock whenever there is oil beneath it. There are, perhaps, a dozen of these greasy wizards perambulating Venango county, and locating wells after this fashion, in consid-e-rn-tion of a ten dollar bill; and what is stranger, there are plenty of people with the ten dollar bill. There is a vein of superstition running through all human nature, whether in Salem or Bedlam or out of them, and good old Dr. Mather was only a little honester than most men, and confessed it."—*Pittsburg Oil News.*

Metallurgy.

EUROPEAN METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

NEW DISCOVERY

FOR DESULPHURIZING AND DECOMPOSING

METALLIFEROUS ORES,

—SUCH AS—

Auriferous Sulphurets, Arsenites or Antimonial Telluric, Gold and Silver Ores.

By this new process, in a short space of time these ores are decomposed or disintegrated so that they may be easily ground in a common coffee or other hand-mill. A patent has been applied for. The right of using is now for sale by EDWARD ARNOLD, Monitor, Alpine county, Cal., or by

DANIEL ROSS,

Traveling Agent for the sale of the above mentioned discovery throughout the United States. All rights sold by him will be recognized by me.

EDWARD ARNOLD,
Inventor and Patentee.

Monitor, Alpine county, Cal.

W. F. BRYANT, Agent, Odd Fellows' Hall, 325 Montgomery street, San Francisco. 2v11

ASSAYERS

Desirous to commence an ASSAY OFFICE in the mines may buy, at a very low figure, in a prosperous mining county, a complete set of Assaying Apparatus, Scales, Chemicals, and everything necessary to carry on said business. Apply to Lock Box No. 782, Postoffice, San Francisco, stating name and where an interview may be had. 17v10

OIL WELL BORING.

J. SEVENOAKS,

Contractor

For Well Boring and Erecting all kinds of Machinery connected therewith.

Having had extensive experience in boring for oil in Pennsylvania, Canada and elsewhere, I feel confident of being able to give entire satisfaction. Persons desirous of making contracts as above, or wishing information with regard to oil indications, etc., will please address me at the office of the "Mining and Scientific Press," San Francisco, or to my personal address, Box 1229 San Francisco. 2v11

Professional Cards.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beidler's pan, Veatch's tubs, Prater's concentrators, Wahlee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices. 21v10 **H. J. BOOTH & CO.**

Miners' Foundry

—AND—

MACHINE WORKS,

First St., between Howard and Folsom Streets,

SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,

Machinery, Mining Pumps, Amalgamators,

Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, FREE OF COST.

All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.

☞ Particular attention given to casting Rudder Braces and Ship Work in general.

☞ All Jobs promptly attended to. Prices moderate. ☜

No. 125 First street, opposite Minna, next door to Pacific Foundry. 3tf

[Removed from Oregon street, between Front and Davis.]

SMELTING COPPER ORES.—Messrs. Peter Spence and H. Davis of England, have made a discovery in copper smelting which consists in using, as a flux, the spent shale of the alum manufacture, being the residuum of the shale of the coal measures after it has been acted upon by sulphuric acid for the production of alum. The quantity of such spent shale necessary for each charge of ore will vary with the character of the ore, and, in practice, is easily ascertained by the workman, who will discover that, when a sufficient quantity has been added, the flux or slag will part easily from the regulus or metal, and enable him to skim off and draw out the slag, without the regulus or metal clinging to it. In practice it is found that, by using spent shale for a flux, a slag more than ordinarily free from copper, or, as it is termed, a clean slag, is obtained, which is a matter of great importance in copper smelting, as when the slag is not clean there is a great loss of copper in consequence. The patentees claim the use of spent shale as a flux in copper smelting.

AN IRON MINING DISTRICT.—The Downieville *Messenger* says the eastern portion of the county has been laid off as an iron mining district, under the name of the "San Saba Iron Mining District," and at a meeting of the citizens, recently held in Sierra City, laws were adopted for the future government of the mines. One company has already organized under the same, and are in negotiation with capitalists for the prosecution of the work.

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11-3m

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction. Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

Astor Gold and Silver Mining Company, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of October, 1865, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 436 Jackson street, San Francisco, or to E. A. Hyne, Superintendent, Gold Hill.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, 436 Jackson street, San Francisco. oc14

Bella Vista Gold and Silver Mining Company, Cacachilas District, Lower California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 9th day of September, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
C C Perkins	161	23	6 90
Angus Cameron 121, 122. 123, 124,	118, 119, 120 167	85	19 50
T W Mulford 89, 90, 91, 92,	93 94, 180	75	22 50
T R Horton 22, 23, 24, 25, 28,	27 28, 153, 179	100	30 00
B C Howard	130	18	5 40
A C Nichols	184	145	43 50
S E Dutton	194	24	7 20
Henry Dutton	192	40	12 00
Henry Dutton	193	30	9 00
Kate Kelly	98	18	5 40
James Sheny	hal of 155	1	30
G S Johnson	163	22	8 50
John Dunn	188	10	3 00
J R Knenzi	170	10	3 00

And in accordance with law, and an order of the Board of Trustees, made on the 9th day of September, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on the 28th day of October, 1865, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. FULLER, Secretary.

Office, 325 Clay street, San Francisco, Cal. oc14

Colorado Mill and Mining Company. The Annual Meeting of the Stockholders of the above Company, for the election of a Board of Trustees for the ensuing year, will be held on Monday, November 13th, 1865, at 7 o'clock P. M., at the office of the Company, 509 Clay street, San Francisco, California.

G. M BURNHAM, Secretary.

San Francisco, Oct. 12, 1865. oc14

Notice.—The Annual Meeting of the Stockholders of the Caledonia Tunnel and Mining Company, for the election of Trustees for the ensuing year, will be held at the office of the Secretary, on Monday, November 13th, at 3 o'clock P. M.

J. M. BUFFINGTON, Secretary.

San Francisco, Oct. 13, 1865. oc14

Comet Petroleum Company, Humboldt County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of October, 1865, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable on the 14th day of October, 1865, in United States gold and silver coin, to the Secretary, at the office of said Company, in San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

L. CROSBY, Secretary.

Office, No. 36 Exchange Building, N. W. corner Washington and Montgomery streets. oc14

Edward Everett Silver Mining Company, Cortez Mining District, Lander county, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 15th day of April, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.

And in accordance with law and an order of the Board of Trustees, made on the 11th day of September, 1855, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the Company, 526 Montgomery street, San Francisco, on the 28th day of October, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

PRESTON MORRIS, Secretary.

Office, 526 Montgomery street, San Francisco. oc14

Hanscom Copper Mining Company, Low Divide District, Del Norte county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of October, 1865, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 609 Market street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. S. SWEET, Secretary.

Office, 609 Market street, San Francisco, Cal. oc14

A Business Compliment.

Petaluma, Oct. 4, 1865.

Messrs. Dewey & Co.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business-like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

Jewett Gold and Silver Mining Company, Gold Hill District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of October, 1865, an assessment of one ($1) dollar per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Friday, the 10th day of November, 1865, will be advertised as delinquent, and unless payment shall be made before, will be sold on the 25th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. M. BURNHAM, Secretary pro tem.

Office, 509 Clay street. oc14

Knox Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of October, 1865, an assessment of forty (40) cents per share was levied upon the capital stock of said Company, payable on the said 7th day of October, 1865, in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 2 Odd Fellows' Hall, in the City and County of San Francisco.

Any stock upon which said assessment shall remain unpaid on the 11th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 25th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

SAMUEL P. HOWES, Secretary.

Office, No. 2 Odd Fellows' Hall, San Francisco, Cal. oc14

Oroville Gold and Silver Mining Company, Oroville, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of October, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 434 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 13th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 2d day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

oc14 ROBT. P. LEE, Secretary.

Simpson Mining and Milling Company, Mokelumne and Excelsior Districts, Alpine County, State of California.

J. S. LUTY, Secretary.

Office, 305 Montgomery street, San Francisco, Cal. oc7

Yosemite Silver Mining Company, Oro Fino District, Humboldt county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of September, 1865, an assessment of one dollar and twenty-five cents ($1.25) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to D. H. CROWE, No. 402 Front street (up stairs), San Francisco, or to JAS. T. MACLEAN, Superintendent, at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday, the 21st day of October, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 6th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. O. PUTNAM, Secretary.

San Francisco, Sept. 20, 1865. se23

RESTORING THE FEATURES OF DEAD BODIES. The following process of restoring the features of a dead body that has undergone putrefaction is being applied with great success. The body is placed in a water-tight shell; twenty pounds of common salt, and one pound of hydrochloric acid are added to the water and the immersion is sustained three hours. The body is then removed, the face is washed with simple water and then with chlorine water, and finally a current of chloride gas is passed freely over the face. The restoration of the features thus rendered is so perfect that the body can be positively identified.

PERHAPS the largest fee that has ever been given to any man of a rank lower than that of royalty, was lately bestowed on M. Nellaton, the famous surgeon. He received a fee of £16.000 for going to Russia to wait on a patient.

"Patent Paper Reel for Telegraph Register."

SAN FRANCISCO, Sept. 18, 1865.

EDS. MINING AND SCIENTIFIC PRESS—*Sirs*:—Having noticed the above heading in your valuable paper of the 9th inst., I beg leave to inform you that the invention is not Mr. L. W. Worth's, but one already patented by me, while a resident of Cleveland, Ohio. His form of reel is one that I first got up in 1863, and filed a caveat for, and afterwards improved by putting some gearing, or clock machinery, so as not to use so much cord. The length of cord that I use now to run all day, would not run his reel one hour. After making my improvement, I applied for a patent, which was granted to me on the 19th of January, 1864. That patent covers all of his, so-called, improvement, as will be seen by my patent (No. 41,312) which claim reads as follows:

"What I claim for my improvement, is the arrangement of the mutually exchangeable reels D and F, in combination with the gears, cord, pulleys, and weight, the several parts being constructed, arranged, and operating as and for the purpose herein set forth."

This patent was obtained for me by Messrs. Brainard & Burridge, of Cleveland, Ohio, Patent Solicitors. And I further state, that all persons wishing to use said Paper Reels, will please to come and make arrangements with me for their use. As for any advantage he has over other reels, it can only be that he has a greater length of cord to wind up. Those that I built, of his style, before I had mine patented and after I filed a caveat, had all to be exchanged for my new Reel. In putting this up it takes only six screws to do the whole business, and takes up so little room that it is quite a convenient and useful instrument.

Address, **HENRY McGANN**,
12v11 At the Union Works, First st., San Francisco.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

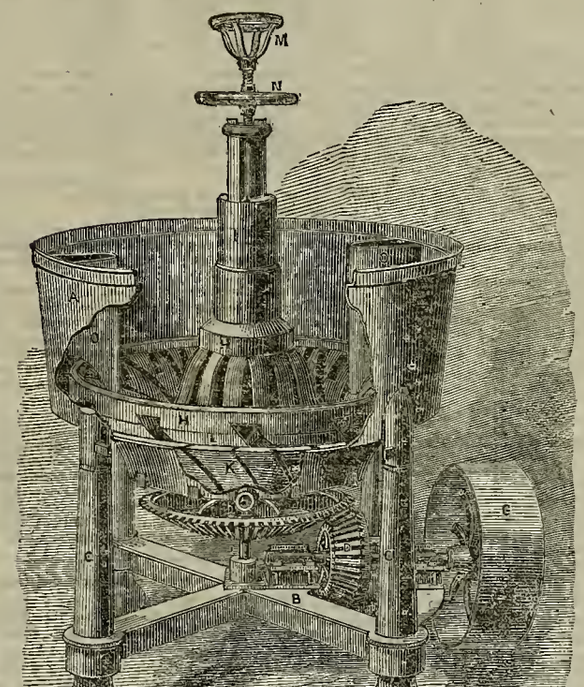
Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE
Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.
SAN FRANCISCO, June 13, 1865.



THE
WHEELER & RANDALL
Grinder and Amalgamator

In the engraving herewith exhibited, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight.....98

The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

☞ Patent applied for.

PREPARING FOR THE FUTURE.—The Government is preparing for the future. A portion of the fleet of the nation is to be housed along the Delaware, and the hundreds of thousands of serviceable muskets and rifles and sabres and sets of accoutrements are being repaired and stored in the various arsenals and forts throughout the country. It would be interesting to know the number of weapons of war of all kinds now in the hands of the Government and the amount of munitions ready for use. The small arms must number millions, the cannon tens of thousands, and the food for both can scarcely be estimated. During the struggle, there have been more than two millions of men under arms in the United States at the same time, and the weapons used were the best known to warfare. Many thousands have of course been destroyed, but the arsenals have more than compensated for the losses, and the number steadily increased, by home manufacture and importation, all through the war. Of the arms used by the rebel armies, probably one-half fell into the hands of the Government. All of these immense quantities of arms and military stores are being laid away by the Government for future use.

NITRE.—The Reese River *Reveille* says that a deposit of what is claimed to be pure nitre has been discovered near Tar Creek, about four miles from Geneva. Mr Riotte, a mining expert, was about to visit the locality to make a thorough examination of the extent and quality of the deposit.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

SALMON'S

PROPELLOR AMALGAMATOR

—AND—

Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 **J. & W. C. SALMON.**

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. (Illustrated in the Mining and Scientific Press, April 9th, 864.)

nov8 3m* HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1861; his Crescoille Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, concentrate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

ATTENTION, MINERS!

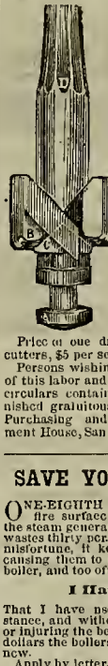
LINSCOTT'S PATENT

CHAMBER DRILL.

Great Improving in Blasting.

W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.



D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ⅝ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1⅜ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it burns the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

JOHN MAILER,

Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco

23v10

Rowe's Patent Æolian Refrigerator.

THIS NEW AND IMPORTANT INVENTION IS NOW offered to the public, with the fullest conviction that it will be found invaluable to the dairyman, and of most essential service in every household. By its use the amount of cream from milk may be increased nearly one-third in quantity, while for general refrigerating and ventilating purposes, it has no equal. Call on OSGOOD & STETSON, 219 Commercial street, San Francisco, and examine for yourselves.

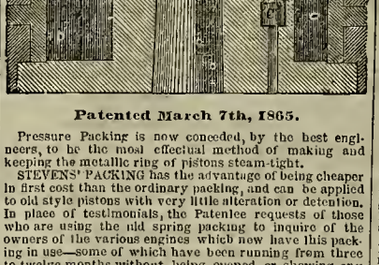
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

STOW'S

PATENT CHAMBER DRILL.

The greatest Labor-saving Machine ever invented for Quartz Mining. By using this Drill in shafts, tunnels, and all other rock blasting, three-fourths of the labor, and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 1¾ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, September, 1865, a Committee, after examining both the Linscott's and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for blasting rock, for the following reasons:

1st. For simplicity of construction;
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for $30, with one set of Cutters or Chisels that will chamber from 15 to 150 holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 7 Government Block, corner Sansome and Washington streets, and at No. 511 Market street. Address

STOW & COLLINS,
San Francisco.

Oil Wells! Oil Wells!!

I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ¼ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to and work with any common drill at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

HENRY M. STOW,
14v11 San Francisco.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S

AMERICAN DOUBLE TURBINE,

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30½. That we may know the proper sized Wheel you require, measure your water in the following way; Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

LEFFEL & MYERS,

At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in saving gold, by even the rudest process, ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1865, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on correct principles which combine Scientific Power with Practical Experience, these Pans extract more gold and silver from the ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crull's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Hengh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6dt

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1864, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5.

MUSICAL INVENTION.—Sax, of Sax horn celebrity, has just brought out an extraordinary invention, by which the sound of all brass instruments (of all wind instruments we believe) can be increased to a marvelous extent, so that a band of six musicians can make as much noise as a band of sixty. In some of these instruments the volume of sound is increased to thirty-five; in others but six or seven.

SINGULAR MINERAL COMPOUND.—The Virginia *Enterprise* has heard of several instances of fire being communicated to an explosive mineral substance found in some of the mines in the Excelsior district, by sparks from the pick. The material is described as a powdery substance lining the seams of the rocks, and supposed to be a mixture of sulphur and nitre.

AGENTS WANTED

—FOR—

The Secret Service, the Field, the Dungeon, and the Escape.

—BY—

ALBERT D. RICHARDSON,

N. Y. Tribune Correspondent.

1,000 COPIES SELLING PER DAY!

The most interesting and exciting book ever published, embracing Mr. Richardson's unparalleled experience for four years. Travelling through the South in the secret service of the "Tribune" at the outbreak of the war, with our armies and fleets, both East and West, during the first two years of the Rebellion; his thrilling capture; his confinement for twenty months in seven different rebel prisons; his escape, and almost miraculous journey by night of nearly 400 miles. It abounds in stirring events, and contains more of the fact, incident, and romance of the war, than any other work yet published. Horace Greeley says of it:

"A great many books will yet be written concerning this war, in addition to the many already in print; but not one of them will give, within a similar compass, a clearer, fuller, more readable account, entirely from personal observation, of the nature, minus, purpose, tendencies, and instrumentalities of the slaveholders' rebellion, than does the unpretending narrative of Mr. Richardson."

Teachers, ladies, energetic young men, and especially returned and disabled officers and soldiers, in want of profitable employment, will find it particularly adapted to their condition. Send for circulars. Address

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers, and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Soake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

U

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

THE LATE EARTHQUAKE ON THE WATER.—A Sacramento gentleman informs the *Bee*, of that city, that at the time of the late severe earthquake he was enjoying a sail in a pilot boat, off the heads, and says that just as the shock occurred the pilot boat was about two miles inside the bar, crossing which was a brig from Oregon. The sea was unusually smooth and the wind light. Just as the shock came, the brig on the bar was observed to plunge violently, the waves running mountain high for a few moments. The sea-swell abated considerably when it struck the deep water where the pilot boat was, but the pilots estimated the hight of the first wave at ten feet.

The effect on the waters of the Mission Bay, which is very shallow with a soft muddy bottom, is described by eye witnesses to be such as to cause the water to surge and boil, not rolling, but apparently bursting up as though there was a violent vertical agitation of the earth beneath the water. The mud was evidently disturbed and the water rendered black by admixture therewith.

STATISTICS recently published show that the deposits in the savings institutions of San Francisco amount to nearly six million dollars, for which money the depositors receive an average interest of one per cent. per month. Out of the city there is not a single savings bank in the State. Neither is there one in Oregon, Washington, Nevada, Idaho or Utah. Generally speaking, the industrial classes of San Francisco, as well as the clerks and small tradesmen, are prudent and forehanded, as their bank accounts attest.

GOLD AT THE MINT.—The total amount of gold and silver coined at the San Francisco Mint, during the quarter ending Sept. 30th, has been $6,781,300, which is $5,531,000 more than the calculated capacity of the Mint building when erected. Compared with the corresponding quarter in two previous years, the coinage account stands as follows:

Quarter ending September 30, 1865	$6,781,300
Quarter ending September 30, 1864	5,945,300
Quarter ending September 30, 1863	6,648,000

THE following is the amount of quicksilver produced by the quicksilver mines within the Second Collection District of California, for the month of September:

	No. of Flks.	No. of lbs.
New Almaden	3,606	352,359
New Idria	293	22,714½
Guadalupe	120	9,180
Totals	5,019	384,253½

LOW WATER.—The Connecticut river at Hartford was forded by a team on Saturday, Sept. 2d, a circumstance which was never known to have taken place before. The river is still very low.

EARTHQUAKE PHENOMENA.

It is not only a pardonable, but even a most laudable desire on the part of thinking people that leads them to inquire into the causes, nature and effects of the various phenomena which are taking place around them. There is nothing in nature, from the most minute microscopic object or effect, to the most distant sphere which rolls in space or the grandest phenomena of earth which are brought within his reach of observation, that man may not consider and study with profit to himself and his fellows.

The phenomena of earthquakes have of late years engaged much attention among scientific men; but owing to the physical difficulties attendant upon careful and close observations, sufficient facts have not yet been collected to afford any very definite conclusions either as to the cause or the particular effects which these convulsions exert upon the surface and superficial crust of the earth.

The most prevalent opinion, however, is that which connects them with the great supposed central heat of the earth—the residue of that incandescent state in which it is probable the entire globe existed at an early period in its development. Under this hypothesis it is assumed that the crust of the earth is of varied thickness, and that it is extensively fissured and contains vast caverns, produced by unequal contractions in cooling. Through these fissures water at times is supposed to find its way to the heated mass within, from which explosive gases are formed similar to those generated when water is brought in contact with molten iron; or perhaps explosive steam is suddenly formed such as occasionally produces the terrible effects we witness at some of our most violent steam boiler explosions.

Some have referred the cause of these convulsions to electrical agencies; but the effects usually attendant upon them are such as to afford very little basis for any such supposition. The only other hypothesis, than the one first named, which has met with any considerable degree of countenance from geologists and scientific men generally, is that which merely qualifies the character of the interior heat—referring it to a chemical origin, rather than that of internal incandescance.

It is well known that some of the metalic bases of the alkalies and earths, such as potassium, for instance, and more remotely sodium, produce a violent explosion when immersed in water, particularly if that water be heated to something more than the boiling point. The vast amount of alkaline matter that modern geographical discoveries have shown to exist upon and near the surface of the earth, has given rise to the very reasonable supposition, that these bases may exist in large quantities within the earth, in the same form in which they are prepared for chemical and commercial purposes. Should such be the case, and should they exist where they can be reached by any considerable bodies of water, there is no need of any internal natural fire or incandescence, to explain the usual phenomena of earthquakes and volcanos. As yet our knowledge of the earth's crust is quite too limited to enable us to say more than that all the conditions of which we speak may exist there, and that those conditions *may* produce all the phenomena which are recorded of both earthquakes and volcanos.

Modern researches and observations, in this direction, have recently added a new branch to the exact sciences, which has received the appellation of *seismology* (from *seismos*, the Greek term for an earthquake). The immediate and most important applications of this science relate to the discovery of the nature of the deep interior of our planet, of its more superficial exterior, and of the reactions of the one upon the other, and of the component parts of the latter upon each other. In connection with the kindred subject of volcanic phenomena, it seemingly affords us a most ready path to a knowledge of the depth from which the shocks proceed, and *may* become a key by means of which we may approximately arrive at the probable or even possible force of any shock which can be delivered beneath any given locality. Observations thus far have demonstrated, to a great degree of certainty, that earthquake movements are produced by heat, that great source of power and motion. The manner in which heat is brought to bear in producing these effects, has already been sufficiently explained.

Admitting the source, we will now endeavor, by aid of various authorities before us, to point out how the tremendous power displayed is conveyed from point to point.

If we fill a tube of any moderate length, perhaps not to exceed a mile, with water, and close both ends, say with a piece of tin or thin iron, and give even a very light tap upon the covering of one end, the effect of that blow may be distinctly perceived at the opposite end by a slight quiver of its thin covering. This force is conveyed through the water by a *pulse* or *wave* of force, originated by the original impulse or blow. This movement of a non-compressible elastic body, like water, is readily conceived; but if we substitute in place of the tube a solid iron rod, it will require but a slightly increased impulse or blow to produce the same result. The transfer is made through both the solid and liquid on the same principle. This *elastic wave* is merely a continuous forward movement, or displacement and replacement of the particles of matter, affecting in succession the whole mass of material upon which the impulse is given. The size of such a wave—or the volume of the particles of matter in motion at once, depends upon the elastic limits of the substance acted upon, and the amount of power expended in the originating impulse. The experiment may be tried upon a line of railroad, more readily over a short section where the rails may be successively in close contact, by striking a blow with a heavy hammer at one end while the observer notices the effect at the opposite extremity. The same effect may be produced through a volume of stone—take a long slab of marble or granite.

The movement of the impulse is the same whether we are made conscious of it by sound or vibrations. Notice when a blast is fired in a quarry or mine; a wave impulse is sent off in every direction—the effect of the explosion. This may be favorably observed in underground blasting for mining purposes.

From these observations it will be readily perceived that when the originating impulse is very violent, and the mass of material acted upon very great, as in case of the supposed earthquakes producing gas explosions, the wave of impulse or force must be proportionally great, and so large in fact as to cause a perceptible undulation of the surface of the earth, and by the transit of which across the country precisely the same effect is produced as is caused by the transmission of a wave, or series of waves, across a body of water on which a ship may be riding at anchor.

From these considerations the fact is considered fully established that an earthquake, so far as it is developed on the surface, is simply *the transit of a wave or waves of elastic compression in any direction from vertical to horizontal, through the crust or surface of the earth from any centre or centres of impulse.*

There are some phenomena, attending earthquakes, which at first thought may appear inexplicable as derivable from such an impulse; among which we may mention a seemingly tortuous motion, the occurrence of which is inferred from the occasional *twisting* of heavy bodies on or from their basis, as projecting chimneys, columns, etc.; the spouting of water from earth crevices, and the occasional gyratory motion imparted to water in confined places, the latter class of phenomena being particularly referred to by a correspondent of yesterday's *Alta*, in support of the electrical theory. We propose to examine these phenomena, with others, in our next issue.

THE SEVEN OLD AND SEVEN NEW WONDERS OF THE WORLD.—The Egyptian pyramids, the Mausoleum of Mausolos, the Temple of Diana, the walls and hanging gardens of Babylon, the Colossus of Rhodes, the Statue of Jupiter, at Athens, and the Pharos or lighthouse of Ptolemy Philadelphus, 500 feet high, have long been considered as the seven great mechanical wonders of the world.

The seven modern wonders of the world are: the Steam Engine, the Printing Press, the Telescope, the Microscope, the Electric Telegraph, the Chemical Laboratory, and the Photograph. The superior utilitarian character of the moderns over the ancients, is most remarkably exemplified in the above enumeration of the chief efforts of the highest mechanical genius of the two classes separately considered.

PATRONIZING HOME MANUFACTURES.—The Pacific Railroad Company daily use two hundred kegs of blasting powder in their operations on the line of road. The whole of this is made by the California Powder Mills, which are kept fully employed in filling orders. The quality of the powder being better, and the price lower, than the imported article.

THE ACTON COPPER MINE, in Canada, owned by a Boston company, and whose shares once stood high on the list, has recently been sold at auction, in Boston, for $20,500. The capital stock was $500,000.

GEN. ROSECRANS expects to leave this city for the East on the next steamer.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

EXPLORATIONS FOR COAL AT CRYSTAL PEAK.

Ths necessities of a mining population, such as that of Nevada, depsndent ou a comparatively limited supply nf wood for ths immense quantities of fuel consumed in miniug and milling operations, as well as for domestic purposes, bave induced in the minds of many persons in our State a ready belief in tbe runors that deposits of good coal had beeu found in tbs districts surrounding Virginia City, which plaes feels ths want, probably, as keenly as any on the Pacific coast.

At intervals during the last twelve months, small samples of coal have been brought to this city from sevcral localities, prominent among which stands Crystal Peak, producing considerable excitement and resulting in ths expenditurs of considerable money; whether with prospscts of success, or otherwise, it is not my intention to examine in ths preseut paper.

Crystal Peak lies immedintely at the foot of the Sierra Nevads, on the eastern slope, at ths point where ths Truckee River turns suddenly to the eastward; the principal explorations having heeu made iu Dog Valley, which runs nearly north and south. In this district, and indeed so far as present explorations have exteuded, for many miles in every direction, there is no trace of the immense heds of the fossiliferous sandstones, limestones and shales, belonging to the older formations which accompany the cnal deposits of America and Europe, and between which they are found. The main mass of tbe Sierras consist of granite, porphyry, metamorphic slate, and basalt. The only true stratified rocks in the neighborhood of Crystal Peak, in which by any possihility deposits of coal could be found, are thin beds of coarse granitic sandstone and whitisb volcanic tufas, or ash, and it is in these that the fragmentary masses of coal occur. As far as I can learn, these heds have afforded no fossils in that immediate district, hut they can he traced for fifteen or twenty miles to the eastward, where they contain many imperfect impressions of willow leaves, grasses, etc., and in one instance the elytron of a heetle, very closely allied to, if not identical with, a specics of *buprestis*, at present found in Western Nevada, attached to the nut pine. These remains indicate for the deposits a very recent date; a view confirmed by the fact that the sandstones and tufas are found only in the valleys at the base of the chief monntain ranges. This latter circumstance goes to show that the country had attained very much its present conbguration before the valleys were again submerged. This fact, combined with the abrupt character of the mountains surrounding the valleys, and the contracted area of those valleys, necessarily limits the extent of the deposits formed within their limits. That they do not overlie, to any extent, the rocks of older date in the vicinity of Crystal Peak, is npparent from the fact that these rocks crop out at a slight elevation above the valleys; and they cannot lie beneath them because they were there before the sandstones, derived from them by the action of the clements, were formed.

There still remain in Steamboat Valley, which lies immediately east of Crystal Peak, nhundant evidences that at one time it formed a large lake, one arm of which extended to Crystal Peak; its shores being formed by the monntain range of the Sierras on the west, and that of Virginia on the east. It was dnring this period that the coal deposits of Crystal Peak were formed. As helore mentioned, the few fossil remains hitherto discovered point to a scanty vegstation, such as characterizes the district at the present day; not to tbe exuberant growth which distinguished the eras of the great coal deposits of the world, and which exceeded in splendor the luxuriant tropical forests of the Amazon and Lower India. When it is remembered that vegetation loses nearly six-sevsnths of its bulk in the process of conversion into coal, it will be seen tbat only undsr similar circnmstances could any large body be formed, and that the flora of Nevada to-day, as then, is utterly inadequate for the purpose. The structure of the wood of the Crystal Rock coal, and the circumstances under which it occurs, render it probable that it is the remains of trees which were washed down from the surrounding mountaius and buried in the narrow arm of the lake before mentioned, under conditions favorable to their transformation into coal. In this case the deposit is boundsd by the mountains immediately surrounding, and can never repay by its extent the eost of extraction.

That tbe sbovs explanation is not far from the truth, will be evident to any one acquainted with coal mining, who will carefully and impartially examine the locality; nor should I have thougbt it worth while to allude to the subject at all, were it not that much valuable time and money have been expended in Nevada, searching for eoal in localities whers a little knowledge and forethought would have convinced the prospectors there was no probahility of success. Some sanguine but misguided individual in one place sank a shaft probably one hundred feet deep, on a mass of lava or obsidian, occurring in a flow of basalt of some miles in extent. True, it resembled coal because it was black and glossy, but the fortunate (!) proprietor must have been slightly astonished when he did discover in the fullness of time that it would not burn. These remarks on misdirected prospecting are not applicable to eoal alone, but may be transferred with equal propriety to much that has been done in the rage for copper and silver, as the "wildcats" of Nevada testify.

In writing the above I have no wish to discourage legitimate enterprise; but would like to see a little of the common sense so highly prized in ordinary business matters applied to miuing as well. It is lamentable to see time, labor and money irrevocably lost, when we have none too much of either to develop resources that would result in advantage to the individuals themselves, as well as to the welfare of the State at large. S. H. R.

[Written for the Mining and Scientific Press.]

A Trip to the Mountains.

NOTES FROM THE JOURNAL OF A. S. N.

COLUMBIA.

Leaving Murphy's and crossing the valley of the Stanislaus, we arrived at Columbia. Placer mining we fiud is still carried on in this section, but not to that extent it has heen in years pnst. It, however, receives considerable attention, and undoubtedly will for many years to come. This has been a rich mining district, and if we might judge of its productiveness from the amount of wurk that has been done, we should say one of the richest in the State. For many square miles the surface of the earth has heen taken up, washed, and drifted off into the valley of the San Joaquin, leaving the rocks naked and desolate, giving the country a decidedly barren appearance.

Two miles north of Columbia, and near the Stanislaus, are the marble works. This quarry has produced some of the finest marble in the State. The color of the marble is grey or clouded, of fine-grained texture, very compact, and hard to work. There is a water-power mill adjoining the works, in which there are four saw-beds, each containing several saws. A large quantity of marble has already been sent to market, and much more yet remains at the mill, sawed into slabs and blocks, ready to be shipped. When a railroad is constructed along the valley of the Stanislaus to Stockton, or some other convenient shipping port, this marble will prove a valuable product of the State.

There are many qnartz mines and mills in this vicinity, some of which are doing little or nothing. We fiud in many cases that the amount of gold obtained from the rock falls far short of what it assays. Incompetent men and imperfect machinery often waste three-fourths of the metals. We helieve that nearly one-half of the quartz mills are idle from these causes. They have failed to save a sufficient quantity of the metal to pay expenses; the rock is pronounced worthless, the work ceases, and the stock goes down. These evils will be remedied in time. In some cases other parties have taken up the work, the machinery has been changed, and the rock is found to pay The result of thsse cbanges is giving confidsnce to our qnartz mining, consequently men more willingly venture their capital.

SONORA.

The town of Sonora, the county seat of Tuolumne county, is pleasantly situated in the centre nf an extensive mining region. It is the finest mountain town we have visited. Thers is considerable trade carried on here; many fine edifices, both public and private, have been constructed, and "her streets are paved with gold." This last assertion may be considered hyperbols; but a scientific man informed us, that by spreading a canvas in his yard, collecting the dust rising from the street, and washing it, he had obtained gold!

Meeting our friend, the Rev. Mr. Hill, we were introduced to Mr. Pitts, who is extensively engaged in mining, and Dr. Snell, one of the pioneers of California, and a man well versed in mineralogy and geology. Dr. Snell has spent his life in these studies, and having arrived to the age of four score years, we found him well stored with knowledge, such as we most desired to obtain. We spent some time in examining his extensive cabinet, and in interesting conversation after which we retired for the night, anticipating a pleasant morrow.

In the morning we started, in company with the Doctor, for Table Mountain. On the way we visited Peppermint Falls, where there are high cliffs of basalt. Walking a distance of three miles, and ascending a high eminence, brought us to the level summit of Table Mountain.

We were first introduced to what appeared to be an ancient crater. It is about one-half mile in diameter, filled with drift, and its surfaces a little lower than the surrounding level. A shaft has been sunk in the crater to the depth of nearly 100 feet, the bottom not having been reached. The character of the drift is the same the entire depth. The surrounding rock, of which the entire mountain is composed, is metamorphic.

Leaving the crater we passed on down the opposite side of the mountain, and visited several tunnels running into it. At the first we obtained some fine blocks of solidified wood. This wood was described to us as having been found in its natural upright position. When first met the trunk was cut off and the part above settled down; the trunk was again cut off, the part above again settled down, which process was repeated till the entire tree was taken out. Several trees have been taken out in this manner, they having the appearance of quietly standing there while the rock was carefully thrown up around them. The tunnels lower down the mountain seem to be following in an ancient river-bed. One of these tunnels penetrates the mountain for more than half a mile, running in under the edge of the crater, at which place it is over 300 feet below the surface. The drift taken out of this tunnel seems to be nearly of the same character as that taken from the other ancient river-beds or channels in this part of the State—gravel, clay, talc, etc. We were shown specimens of stone nicely carved and undoubtedly the work of man, which were said to have been taken out of one of these tunnels, placing the period nf this formation during the "stone age." We did not see the person who found these relics, but many here believe that they were taken from the heart of Table Mountain. We were, however, a little skeptical on that point.

After spending the day in viewing Tabls Mountain we retraced our steps and gladly sought rest, wondering, from our own fatigue, that a man eighty years of age could endure such a journey. We wished we could have spent more time in studying the strange formation ot this mountain, for it certainly is an interesting field for the geological student. On the following morning we again visited Dr. Snell's cabinet, and spent the greater part of the day there. When we left, the generous doctor loaded us down with specimens for our own cabinet, many of which were valuable and rare.

[To be Continued.]

Petroleum on the Plains.—Col. A. A. C. Williams of the first Nevada Cavalry says that at a point within five or six miles of Quaking Asp Station on the Overland route, about thirty miles from Fort Bridger, and ninety from Salt Lake, there are a number of very fine springs of petroleum. In one place about an acre of the soil is so strongly impregnated with the oil that it can he freely squeezed out with the hands, and a cane thrust down into it leaves a hole that will be filled with oil in a few moments. A trench has heen dug in this oil saturated spot from which the crude petroleum flows at the rate of from six to ten barrels per day. These springs are situated within five or six miles of the present surveyed route of the Pacific Railroad, and will at no distant day become very valuable. The existence of these springs has long heen known to the Indians, who often visit them in order to procure the oil for the purpose of bathing the chafed backs of their ponies.

Musical Rivalry.—The city of Boston has the largest organ in the United States. Boston occasionally alludes to the fact, which hurts the pride of New York. So New York is going to have a larger organ than Boston.

[Written for the Mining and Scientific Press.]

Notes of a Trip to the Mines of Lower California and Arizona.

NUMBER. II.

LOS ANGELES TO SAN BERNARDINO.

The country from Los Angelos to San Bernardino is quite level, and in many places very fertile; though not much cultivated. At Cocomongo there is a large vineyard, and much wine is made there. The San Gabriel river, one-half a mile wide, was the first of those rivers of California that in the dry season would be taken by strangers for a desert, which the writer had ever seen; but before long they became quite common; in fact we always crossed, with but two or three exceptions, rivers on dry land. On our left were ths mountains of the same name.

The first night out of Los Angeles I slept ont of doors for the first time in my life, and had it not been for the noise made by ths dogs and coyotes, should have enjoyed it. A very heavy dew fell, and I found it quite damp in the morning, hut felt no ill effects from it.

SAN BERNARDINO,

The only town of importance on the road to Arizona, *via* Camp Cady, is a place of about twelve hundred inhabitants, the business being mostly done by Jews. It is on the direct road from San Pedro to Salt Lake City, and its trade with that city is very large. Formerly it was occupied almost entirely by Mormons, but they have long since joined their lord and master, Brigham Young. Two crops a year are raised on the land in this vicinity, and the green fields seem intensified in color after crossing the dried-up plains.

LEAVING SAN BERNARDINO,

We commenced ascending the monntains, and soon were in Cajon Pass. At night camped at the Toll Gate. After supper, the first of my cooking, which consisted of quail, pigeons, fried bacon, potatoes and coffee, I laid myself down upon an India-rubber bed, filled with air; and here I would say that these beds are admirable things for camping, being easily filled when required for use. The next day we moved through the Pass, and found ourselves on the top of the Sierra Nevada. We had some fine scenery while traveling through the cañon—in many places there being only room for one team. It seemed as if natnre had made the gap for the purposes of travel. Immense rocks hung over the road, which seemed to have so little attachment to the walls that a sense of relief came over us when they were passed.

A walk in the early morning, up a rather steep grade, is very tiresome, and we were glad when we were on level ground. Continning on from here, the road lay through chapparel for some miles, and then we came out nn the first desert we had seen, and here a very singular tree—the yucca—met our eye.

THE YUCCA

Is a species of palm, growing from six to fifteen feet high, with a trunk from six to ten inches in diameter. Generally it has but two branches, yet, we saw some with four or five. The leaves, resembling the blade of a bayonet, hang down the sides of the trunk. The smaller trees, at a distance in the dark, might very easily he mistaken for Indians. This tree has a great deal of oil in it, and when dry burns easily. Travelers use it for their camp fires. Where fuel is needed for engines it will he a good generator of steam. There was also a bush or tree, about three feet high, which had no branches; the leaves, sword-shaped, and twenty inches in length, grew from the sides upwards; and as they died, turned downwards, presenting a very odd appearance. These were the only signs of vegetation, save here and there some little weed. About noon the first crossing of the Mohave river, which was here merely a little creek, was reached. The close of the afternoon gave us a most gorgeous sunset.

CAMP CADY.

After two more days of travel we reached Camp Cady, where ninety soldiers are stationed, under command of Captain West, for the pur-

pose of keeping the country free from Indians, and giving assistance to emigrants; but the commandant pays no attention to either party, as we ascertained from travelers and from our own observations. The soldiers are building adobe houses, and they will soon have quite a respectable settlement. The next day we reached

THE CAVES.

This locality obtained its name from its being a deep gorge, the earthy sides of which are pierced by innumerable caves. A ride through by moonlight affords fine scenery; it does not require a very great stretch of the imagination to see magnificent cathedrals, castles, and, in fact, architecture of every description.

Here commenced our troubles; for the weather being very warm, our thirst was greatly increased, and we could find no water to quench it, all being strongly alkaline. If we attempted to sleep we could not, for a fly, about three-quarters of an inch in length, kept up a continual buzzing around us, and when an opportunity offered, would bite unmercifully. Our stay there was not long, and we traveled all night to reach Salt Lake.

LACK OF WATER.

In the road we dug up some water which the driver had casked some weeks before. The teamsters are obliged to fill casks with good water, and hide it in the sand, for their return trip between the lake and the caves. Though that which we exhumed tasted very strong of sulphur, (having been putrid, and then becoming sweet,) we drank it with a relish. We could quench our thirst at Soda Lake, for we found a soda spring, the water of which, though not so good as we could wish for, was very palatable, and had it been cold, with a little syrup, would have tasted well. Our enemies, the flies, still troubled us here. A bath in the spring was delightful, the water being very soft.

SODA LAKE

Is about five miles in width and twenty in length—is but a valley covered with soda; to us it looked as though a light snow had fallen through the night. Had there not been heavy rains, we should have obtained some fine crystals of soda. On account of the rains we had to go around instead of across it, as it was very miry, some teams having been mired in the attempt to cross. Our next station after passing over a desert was Morrel Springs, the water of which is strongly impregnated with iron; but we contented ourselves with it, for we were told that we should find pure spring water at Rock Springs, and on tasting it pronounced it the best we had ever drank. If any one knew how to appreciate it, we did.

THE MINES.

Since reaching the summit of the Sierra Nevada, the roads have been through a heavy sand, which is very hard on loaded teams. It was at this point, Rock Springs, that we came upon the first mining locality to be met with on this route. It lies near the Providence Mountains, and is about 4,800 feet above the level of the sea. We examined the first lead—"Donna Carolina"—which was opened in this vicinity. It is quite narrow, not very rich in silver, and was soon abandoned. Had it been worked deeper, there might have been found enough of the precious metal to pay. Passing over to the Macedonian district, which lies in a spur of the same mountains, better signs of silver presented themselves. The topography was made up of high ragged mountains, almost devoid of trees, though more than in many mining regions. The trees consist of the shrub, cedar, and piñon pine—the latter large enough to be used for timbering in the mines. Upon the adjacent plains the yucca grows in great abundance, and will furnish sufficient fuel for years. Tuft-grass grows nearly all the year, and in large quantities, furnishing fodder for such animals as might be required in opening the mines. Water can be obtained by digging two or three feet, wherever a weed called water-weed is found, and by blasting it might be obtained in abundance.

I saw many fine croppings of mineral, which are said to assay from $20 to $120 in silver to the ton, and from $15 to $20 in gold. Some of the ore that is rich in silver will assay from eight to twenty per cent. of copper. The leads run in a northerly direction, dipping to the east, some of them lying between granite and marble walls. None of these have been worked to any extent, but short tunnels have been run, which give good prospects. There are other districts in the vicinity, the leads of which are well spoken of, but I did not visit them. Silver Mountain contains some very rich leads, but they have not been opened. It is thought that the cereals and vegetables can be raised on the plains.

FORT MOHAVE.

Forty-six miles of horseback travel found us at Fort Mohave, in Arizona. The road leading there is very good, with the exception of that over Piuto Hill, which is in a miserable condition. The hill is very steep, and full of immense boulders. A better road might be built around the hill at a small cost. The Colorado river, at Fort Mohave, looks like the river at Sacramento, and is crossed by a hand ferry. Fort Mohave is garrisoned by one company of ninety soldiers. They live in adobe houses, just back from the river bank. The town in which the citizens live has a dozen houses, all adobe. We found it very hot, the thermometer standing in the shade at 115°. They told us that was cold, compared with some of their weather! The Indians are the Mohaves, and are quite peaceable, doing nothing worse than stealing. They are never troublesome to the miners, either here or in the districts visited in Lower California. Our destination was the San Francisco district, which lies about twelve miles in the interior, and contains some very fine leads, of which we visited three—the Moss, Dayton, and Bella Union. Here, as in the Providences Mountains, we found nothing but rugged, barren scenery. There are no trees to be seen, the absence of which is one great disadvantage of the district. Good timber, it is said, can be obtained high up the river. Water, we were informed, is easily obtained.

THE MOSS LEAD

Has been worked more than any other, and is very rich in gold. Short tunnels have been run into it, from which they are taking good ore; a shaft some seventy feet in depth has been sunk, but at the time of our visit work was entirely suspended. Mr. Hardee, the founder of the town of Hardeeville, we understood, had a small mill, and was negotiating for some of the ore to work in his mill. Could the mine be controlled by a few persons it would pay handsomely to work it.

The "Dayton" is a silver lead, upon which a shaft, about fifty feet in depth, has been sunk. Fine specimens of ore are taken from it, and it must prove a valuable mine. No work was being done on it. The "Bella Union" has not had any shaft sunk upon it. The croppings show good indications. The ores consist mostly of sulphurets of silver. In the "Dayton" mine in Arizona, the chloride, in the form of horn silver, has been found in some quantities.

TRANSPORTATION.

Freight to Fort Mohave, by the way of Los Angeles, from San Francisco, will be about twelve cents per pound. Very soon there is to be a regular line of vessels and steaming from San Francisco, leaving there the first of every month, making the connection at the month of the river. Freight to the fort will be from $65 to $75 per ton. Navigation is not impeded at any time during the year by low water. They have barges that will carry from 120 to 140 tons to the fort, and 100 tons to the head of navigation. Some vegetables are being raised on the low lands, and much more might be raised if the people were not so lazy. With plenty of capital in the several districts which I visited, the mines must prove remunerative.

OUR RETURN

To Los Angeles was much quicker than the trip out. We hoped to be able to reach there so as to take the steamer Pacific to San Francisco; but we could not, and left on a Friday morning, at half-past three, in the Overland stage, reaching San Francisco on the following Monday, traveling all the time, but Saturday night passing on our way through Santa Barbara, San Benventura, San Luis Obispo, the Warm Springs, and San Jose. The ride along the coast was quite pleasant; but the most of the journey was very hard, the stage being crowded, having three on a seat the most of the time. We would advise persons going to or returning from Los Angeles, to take the steamer and enjoy themselves. To be sure, a great extent of country is seen by the Overland route, but it hardly pays. Though life in the mountains has its pleasures, it seemed like living to get back to the city again.

LEON T. HARVEY, M. D.

A CALCULATING HEN.—The Canton, Mo., *Press* is responsible for the following, which is certainly different from any hen performances in these parts. Our hens are ambitious to sit as extensively as possible: "A few days ago, a hen was found on a neighboring farm, incubating upon a nest of five eggs. Considering that too small an undertaking for a full-grown hen, the owner removed these and placed thirteen fresh eggs in the nest. On examination soon after, it was discovered that the old biddy had deliberately rolled out eight, thus refusing to cover more than the original number. Four times the experiment was repeated, with a similar result, and the obstinate hen was finally left to her select number, thus furnishing evidence not only of her reasoning powers, but of true feminine spunk."

RED CHALK has been discovered in Kansas. Some workmen were excavating for a building at Leavenworth, and struck a strata of this mineral.

Oil Items.

The vertical bitumen lode, at Cairo, still attracts great attention. This lode is situated on McFarland's Run, a small tributary of the South fork of Hughes River, about eight miles from Cairo Station, and twenty miles east of Parkersburg. The mineral has been traced one and a half miles in a line running south, 75 degrees east. The lode is five feet wide.

The Crowell Petroleum company, of New York, are pumping the finest lubricating oil from their new well in Frederick, Trumbull county. It sells in the neighborhood for $40 per barrel.

A BIG OIL STRIKE IN KENTUCKY.—The Louisville *Democrat* of August 13th, says that one of the greatest oil strikes in the United States, is that which occurred a few days ago in Cumberland county, Kentucky, in which the New York and Kentucky Oil company struck oil at the mouth of Crocus Creek, and that the well, on the 8th (the day oil was struck) was flowing at least 1,000 barrels per day; that some persons who saw it estimated it even as high as 3,000 barrels per day. Some idea can be formed when he says it was flowing a stream sometimes from five to six feet high, through an eight inch square, and flowing pure oil.

TITLES TO OIL LANDS.—In consequence of the loose manner in which business was transacted pertaining to the transfer of real estate in Venango county, Penn., where the lands were of little value, there has, now that the oil region has become so valuable, arisen great embarrassment as to the validity of titles. Real estate litigation is rapidly increasing, and millions of property are in dispute. This should prove a useful hint to California oil-seekers, and lead them to perfect their titles ere expending much money in the development of other claims.

It is generally considered probable that neither coal nor petroleum was produced the one from the other; but that both are the products of organic decomposition, the difference in the results being due to the different conditions under which the decomposition took place.

THE LOSS OF THE ALEXANDRIAN LIBRARY A BLESSING.—Scholars and artists have mourned for ages over the almost universal destruction of the works of ancient genius. The Alexandrian library is believed to have contained a greater treasure of intellectual riches than has ever since been hoarded in a single city. These, we know, have all vanished from the earth. It furnished fuel for years for the baths of illiterate Moslems. I used myself frequently to wonder why it pleased God to blot out of existence these products of ancient genius. But the solution of this mystery is found, I think, in the remains of Herculaneum and Pompeii. We there discover that every work of man was so penetrated by corruption, every production of genius so defiled with uncleanness, that God, in introducing a better dispensation, determined to cleanse the world from the pollution of preceding ages. As, when all flesh had corrupted His way, He purified the world by the waters of a flood, so, when genius had covered the earth with images of sins, He overwhelmed the works of ancient civilization with a deluge of barbarism, and consigned the most splendid monuments of literature and art to almost universal oblivion. It was too bad to exist, and He swept it away with the besom of destruction.—*Dr. Wayland.*

A SUBLIME TRUTH.—A late number of the New York *Methodist* contains a full report of an admirable address made by Bishop James, of the Methodist Episcopal Church, before the English Wesleyan Conference, at its recent session at Birmingham. In the course of his address, which was a brief review of the history of American Methodism, the Bishop paid this tribute to the institutions of his country:

"In the United States, both in Church and State, we have learned to trust the people, and neither in Church nor State have the people proved themselves unworthy of any great trust committed to them. Laying responsibilities on intelligent masses has the same effect as putting them upon individuals—it makes them conservative."

BARKING OF DOGS.—Dogs in a state of nature never bark; they simply whine, howl and growl; this explosive noise is only found among those which are domesticated. Soanini speaks of the shepherds' dogs in the wilds of Egypt as not having this faculty; and Columbus found the dogs which he had previously carried to America to have lost their propensity for barking. The ancients were aware of this circumstance. Isaiah compares the blind watchmen of Israel to these animals: "They are dumb—they cannot bark." But on the contrary, David compares the noise of his enemies to the "dogs round the city." Hence the barking of a dog is an acquired faculty, an effort to speak which he derives from his associating with man.

NATURE'S PROGRESS LIMITED.—It is often remarked how few of the distinguished men of earth leave heirs to their name and fame. This is true; not only of those who have become distinguished as warriors and statesmen, but is equally common, if not more so, among those who have attained purely literary fame. Every reflective reader will readily call to mind numerous instances in our own country. But, perhaps, the most noticeable facts in this connection may be found in the consideration of how few of the poets of the last two centuries have bequeathed their name through descendants. Cowley, Butler, Otway, Prior, Congreve, Gay, Phillips, Savage, Collins, Thompson, Shenstone, Akenside, Goldsmith, and Gray, died childless. Pope, Swift, Watts, and Cooper were unmarried, and Johnson was childless. The descendants of Dryden, Addison, and Parnell did not pass to the second generation; those of Shakspeare and Milton became extinct in the second and third. Hugh Miller regards this portion of literary history as an illustration of Doubleday's curious theory of population. The human mind attained in these remarkable men is full of development, as the rose or carnation under a long course of culture, at length suddenly *stocks*, and doubles and widens its gorgeous blossoms of a thousand petals; and when in its greatest perfection, transmission ceases, and there is no further production of the variety thus amplified and expanded to the full. Nature does her utmost, and then stopping short—does no more.

HINTS ABOUT HEALTH.—Intense thirst is satisfied by wading in water, or by keeping the clothing saturated with water, even if it is taken from the sea.

Water cannot satisfy the thirst which attends cholera, dysentery diarrhœa, and some other forms of disease; in fact, drinking cold water seems to increase the thirst, and induce other disagreeable sensations; but this thirst will be perfectly and pleasantly subdued by eating a comparatively small amount of ice, swallowing it in as large pieces as practicable, and as much as is wanted.

Inflammations are more safely and far more agreeably subdued by the application of warm water than of cold.

No man can possibly sink if the head is thrust entirely under water, and in this position a novice can swim as easily as walk, and get to shore readily by lifting the head at intervals for breath.

Hartshorn—the common spirits—is a good and convenient remedy for common bites. Always take it with you in traveling.—*Hall's Journal.*

INTERESTING CHEMICAL FACTS.—A platina crucible is made and maintained red hot over a large spirit lamp. Some sulphurous acid is poured into it. The acid, though at common temperature one of the most volatile of known bodies, possesses the singular property of remaining fixed in the red-hot crucible, and not a drop of it evaporates; in fact it is not in contact with the crucible, but has an atmosphere of its own interposed. A few drops of water are now added to the sulphurous acid in the red-hot crucible. The diluted acid gets into immediate contact with the heated metal, instantly flashes off, and such is the rapidity and energy of the evaporation that the water remains behind and is frozen into a lump of ice in a hot crucible from which, seizing the moment before it again melts, it may be thrown out before the eyes of the astonished observer. This is indeed "a piece of natural magic" and as much like a miracle as any operation of the forces of nature could produce. It is certainly one of the most singularly beautiful experiments imaginable. It was devised by a French savan to illustrate the repellant power of heat radiating from bodies at a high temperature, and of the rapid abstraction of heat produced by evaporation.

CALIFORNIA MINERAL YIELD.—The Virginia *Enterprise* truly says, California yields gold from Yuba, Butte, Shasta, Siskiyou, Trinity, Sierra, Plumas, Nevada, Placer, El Dorado, Amador, Calaveras, Tuolumne, Merced and Mariposa; silver abounds in Alpine and Mono; copper in Calaveras, Santa Clara, Plumas, Amador, Mariposa and Stanislaus; coal in Contra Costa; quicksilver in Santa Clara and Napa; borax in Lake; petroleum in Santa Barbara, Los Angeles, Humboldt, Colusa and Tulare. And now the long felt void is filled by the discovery of well defined ledges of iron in Sierra.

BLAST FURNACE EXPLODED.—On the 2d inst., the blast furnace at Fort Edward blew up with a terrific explosion, destroying nearly everything pertaining to the furnace except the tall brick chimney. Although workmen were present when the explosion took place, none of them were injured. The loss will reach $15,000. The furnace was owned by John A. Griswold and others, of Troy, New York.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 21st, 1865.

The moncy market is well supplied with available capital, but rather more activity may be observed aad bankers meet with no difficulty in effecting loans upon first-class business paper and satisfactory collaterals, at 1@1¼ ₱ cent. per month. A steady requirement in mercantile circles, mainly for speculative purposes, has prevailed for some time past, and among stock dealers there is little or no abatemeut of the pressure alluded to last week.

Receipts of Treasure from domestic sources, during the week, amounted to $950,000, making an aggregate of $3,100,000 since the 1st inst. Bullion has been in fair request, and sales of gold bars were made at 855@865. Silver is quotablo at par to 1 ₱ ceut. premium—the latter for bars of high grade.

The following figures servc to show in some degree the currency movement of the past nine months :

Coin remitted to the interior	$8,725,858
Coin received from the interior	3,773,389
Added to interior circulatiou	$4,952,469

The expenditurcs and disbursements of the Government oa this coast continuc to form an important feature in fiscal matters. The amount disbursed during the past nine months eadiug September 30th, exceeded $12,500,000, and the income of the Governmeut for the same period, from all sources, amounted to $8,000,000.

The total value of the gold and silvcr bullion coined at the Branch Mint in this city, during the past uinc months, amounted to nearly *seven million dollars*.

The serious depression, incident to all stocks last week, still continues, and the market has presentcd a very cheerless vicw the past day or two, with a slight rally, however, in some shares at the close. Considerable stock has been sold this weck to caver advaaces, and in many instances those who were uuable to respond promptly, have beea sold out without much regard to the losses sustained. This hypothecated stock will now pass into the hands of stronger holders.

Alpha, owing, it is said, to the poverty of the ores reduced lately, and to unfavorable developments in the upper portion of the minc, has been in much less favor, receding from $1,900 to $1,050, theu selling at $1,110@$1,090, and closing ycsterday at $1,000 bid.

Yellow Jacket was dealt in to the extent of 120 feet, receding from $1,075 to $990, dropping to $790, and selling at the close at $700 @$720. During the week ending October 9th, 964 tons of ore wcre extracted from this mine, aad 1,090 tons were reduced, yielding an aggregate of $38,801.66, or an average of $35.62 per ton. The east stratum of ore in the lowcr level is said to average some 15 feet in width, and favorable indications have been mct with iu the northwest drift (same level) in ruuning for the west body found above.

Gould & Curry has been rather steadily maintained, and 20 fect were sold within a range of $1,025@1,070, closing at $1,015. The extraordinary expenditures of this compaay during the past quarter have exceeded $250,000, mainly for wood, timber, quicksilver, aad other winter supplies, to last uotil May next, and some disbnrsements are still required for the same purpose. Next month, however, their ardinary surplus earniags can and will probably be applied to the dividend account. Their cnurteous and very efficient superintendent estimates the different bodies of ore between the croppings and the D street tunnel, 200 feet from the surface, at 6,000 tons, which will yield an average of $75 to $80 per ton. Below this level thirty-five feet, there still remains a body of ore 400 feet in length, which, it is thought, will produce at least 8,000 tons, worth, say $35 per ton, and other small deposits known to exist in the upper and lower portioas of the mine are also likely to yield something if oven ao further developments should be made. Four new stations are to be opened below the lower tuanel, or 425-feet level, the lowest to be 825 feet from the surface. This work is progressing with great vigor, and preparations are now being made to open the second and fourth statious.

Savage rose from $1,005 to $1,090, fell to $960, and clnsed at nbont $930; some 29 feet in all changiag hands. It is stated that a permanent body of ore has beea developed in the lower levcl, at least 50 feet in width, aad the drift on the vein continues in good ore.

Crown Point fell from $900 to $750, and closed yesterday at $750 bid. The drift from the 300 feet level is making but little headway, owing to the large volume of water met with. The two inclines from the 230 feet lcvel continue in orc; the south one does not look quite as well as it did a short time since, but the other (on the east stratum) shows some improvcment.

Belcher rceded from $590 to $520, then changed hands at $390, aud sold at the close at $400. This company recently mct with a deposit of good ore, some 13 inches wide, within 200 feet of tho south liae af the Crown Point, at a depth corresponding with the 230 feot level in the latter mine. This is supposed to be a continuation of the west body of ore found in tho Crowu Point.

Ophir has been actively dealt in, and nearly 200 feet were sold, advancing from $390 to $455, then selling at $390, and closing at $380. A considerable body of water has made its appearance again in the Mexican shaft.

Chollar has been in much less favor, and some 250 feet were dealt in, advancing from $430 to $480, buyer 30, receding to $385, and selling yesterday at $380@$370. Potosi has also been active at decliaing rates, and 220 feet changed hands, rising from $415 to $450, buyer 30, steadily dropping to $360, and selling at the close at $350@ $355. These two mines are now producing an average of 150 tons of orc per day. In stoping up from the 385 feet lcvel in the central portion of the Chollar mine, it is said that a veia of pay ore, some 25 feet widc, has been met with. The Bajazet chimney in the Potosi claim is represeuted as showing a decided improvement, and it is thought that this body af ore will extend 100 feet in leagth, with an average of 25 feet in width. The prospecting shaft sunk from the lowor or 485 feet level ou the Potosi, is now down 75 feet, and continues in good ore.

Hale & Norcross receded from $425 to $350, rallied at $380, then dropped to $327½, and closed yesterday at $320@325.

Empire Mill and Mining Company fell from $195 to $162, and closes at $160. The east drift from the lower level has not yet met with ore.

Imperial was dealt in to the extent of some 1,200 shares, advancing from $195 tn $212, steadily declining to $180, buyer 30, and selliug at $172@$175. The receipts of bullion since the 10th instant, including cash surplus then oa hand, exceeded $55,000. Thero is no matcrial change to note in the condition of the mine, save that in stoping up from the sixth level a better quality nf ore has been found.

Bullinn dropped from $105 to $75, and sold yesterday at $70. Confidenco was sold at $72½@$85, closing at $65. Daney receded from $26 to $20, and closed at $15. Sierra Nevada fell from $18 to $14, and sold yesterday at $12½.

The total recorded sales nf stocks, since Saturday last, amounted to $994,947.00.

MINING AND SCIENTIFIC PRESS PATENT AGENCY.

For the Pacific Coast.

OFFICE AT THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice at the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, and if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely recommend his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp to return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will ofttimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we a cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity at having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 years and 6 mos...	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

MINING BLANKS

For Sale

AT THE

OFFICE OF THE MINING AND SCIENTIFIC PRESS,

No. 505 Clay Street, corner of Sansome.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186, according to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]

Dated 186

Assessment Notice.

..... Company

....

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ....., 186, an Assessment of .....per share was levied upon the Capital Stock of said Company, payable on the ..th day of .....186, in United States gold and silver coin to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186, to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.

Office.....

NOTICE.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186, the several amounts set opposite the names of the respective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophilus Thistle	23	14	$140 00
Peter Pipe	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ....., 186, so many shares of each parcel of said stock as may be necessary, will be sold at the.....

....., on ....., the ..th day of ....., 186, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.

Office.....

☞ Our advertisers are furnished with blank Assessment Sale notices free of charge. Orders from the interior promptly filled, by mail or express, as may be desired.

A Business Compliment.

PETALUMA, Oct. 4, 1885.

MESSRS. DEWEY & CO.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business-like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

Mechanical.

A New Principle of Furnace Building.

An unusually large amount of attention has been directed to improvements in furnace building, during the last four or five years, both in Europe and on this continent. Among the improvements really novel, may be classed those quite recently introduced by Mr. E. B. Wilson, of London and Glasgow, Great Britain, by which he claims to effect a perfect combustion of the coal, with an entire absence of smoke, and a consequent attainment of the highest possible degree of economy in furnace working. The editor of the Glasgow *Morning Journal*, after a free and careful examination of the improvement, says that "the invention seems now to have been brought to the highest state of practical efficiency."

The principle upon which Mr. Wilson has based his improvement, is that of carrying on combustion inversely to the usual practice—that is, *by forming the fuel from the upper surface downward and inward*, instead of from the lower surface, upward and outward.

In carrying out this idea, says the *Journal*, the invention dispenses entirely with furnace bars, and instead of the ordinary feed door, introduces an aperture in the top of the furnace, through which both fuel and air are supplied, and which can be readily opened or closed as required. The coal, introduced at this opening in small pieces, falls on a sort of curved inclined plane, where it lies in a sloping bank till consumed. In front of the heap of coals is what the inventor calls a "mixing chamber," formed by raising the roof of the furnace in a slanting direction. As combustion goes on, the whole mass of fuel slides gradually downwards, leaving room for the fresh coal, which, in small quantities, and at short intervals, is supplied at the top. When the furnace is in full operation, the door above described is kept wholly or partly open, and the whole of the atmospheric air necessary to carry on combustion is admitted through the inlet thus made. On first rushing in the air passes through a cold stratum of fuel, extending a few inches downwards. Below this the coal commences to smoulder, giving off free carbon vapor and hydrogeneous gases. These gaseous products become rapidly and completely combined with oxygen, whilst at the same time a sufficient surplus of oxygen is admitted to keep in vigorous combustion the solid carbon on the onlside of the smouldering fuel. It will thus be readily understood that before the gases evolved from the coal can pass through the outlying stratum of burning carbon, the gaseous mixture, of course, catches fire, and adds to the heat obtained from the solid fael that derived from its own perfect combustion.

While this process is going on, the heating chamber of the furnace is kept continuously filled with intense white flame. The effectual burning of the gases thrown off from the fuel is, we need hardly say, a great source of economy. In the ordinary process of burning coal on fire-bars, these gases pass immediately from the hottest part of the fuel, through the cooler coal lying on the top, and thence to parts of the furnace of still lower temperature, the result being that the greater portion of them escapes into the chimney unconsumed. By Mr. Wilson's method, again, the gases pass from a cooler stratum of coal into one in a violent state of combustion, and are, in consequence, completely burnt, thus adding immensely to the heating power of the furnace.

The improved furnace has been applied both to a puddling furnace and to a furnace employed for heating bars for subsequent manipulation. It is said that the invention gives the highest satisfaction both to the employers and the employed, in the establishment where the experiment was tried. The saving of fuel was found to be fully one-third, as tested side by side with a furnace of the old construction. The refuse, after forty-eight hours' work, did not half fill an ordinary hand-barrow. The furnace is, moreover, almost self-regulating, as it requires but a small supply of coal every ten minutes, while the mass of fuel slides down automically into the interior. The refuse is removed once each twenty-four hours, through a small door in the side, which is kept hermetically sealed, except during the operation of removing the refuse, which occupies but a few minutes only. The time required for getting the furnace at work is also less than that required for those of ordinary construction.

It is said that the improvement can be added, with small expense only, to furnaces generally. The inventor has been experimenting with his furnace for several months. At first he found considerable difficulty in getting beyond a certain degree of heat; but by subsequent modifications of his improvement, he was finally enabled to obtain the utmost intensity of heat; which can also be concentrated within a limited space, or diffused over considerable area, as is desired by the operator.

If the statement as given by the Glasgow *Journal* is correct, in the main, this invention is a most important *desideratum*, and would be well worth looking after and inquiring into by the foundry men of this State. We see no reason why it should not be equally applicable to furnaces for making steam, although no mention is made of such an application by the authority before us.

A Linseed Oil Manufactory, with a capacity to work up 1,500 bushels of flaxseed weekly, is to be established on Townsend street, near the South Beach, in this city. The necessary machinery for the same is already contracted for in the East. An establishment for breaking flax and manufacturing linen, in connection with the oil factory, is also projected, thus adding two more important industrial interests to those already established in the State, and which are calculated to render California every year more and more independent of the older States of the Union and of Europe.

Manufactories in California.—The census returns for 1860 represent 3,777 manufacturing establishments in California and Oregon in that year, with an invested capital of $23,380,334, paying for the raw material consumed $28,483,626; employing 50,737 male and 67 female hands; paying for labor $29,037,543, and producing annually goods amounting in value to $71,229,989, $44,927,333 of which were the products of gold mining.

Thin Iron.—Experiments on thin rolling sheet-iron appear to be continued in England. The latest effort is said to be a sheet of iron so thin that it requires forty-eight hundred sheets to make one inch in thickness. That is working the thing down rather too fine for our credulity. The thickness designated would not exceed that of tissue paper.

Cheap Rents.—A "House Building Company" has been organized in New York, for the purpose of supplying men in moderate circumstances with decent houses, at living rents. The company builds the houses in convenient blocks, with good space for common grounds, and sells them at cost and interest.

A Monster Pig Trough has recently been constructed at Dorchester, England, for the famous Dorsetshire swinery, 500 feet long, and shaped like a horse-shoe. Two thousand pigs will be able to feed out of it at one time.

A New Combustible has been patented in Paris, said to be very pure charcoal, finely ground and made into a paste with starch. The paste is moulded into cakes or balls of different sizes, and then dried. When perfectly dry, these may be lighted with a lucifer match, and will continue to burn steadily, like German tinder, without giving flame or smoke. The combustible is intended for heating urns, chafferettes, etc.

Acknowledging their Indebtedness.—The Liverpool *Post* says that the most curious circumstances in the assemblage of English and French ships at Plymouth is, that both these nations "owe mainly to the Americans *the models* upon which they are now perfecting their vessels." That is not the only thing for which they are indebted to us. The experiment of big guns in naval warfare is another important fact which they are just beginning to be impressed with.

New Artificial Light.—Mr. Jas. Wilkinson, of Chelsea, is endeavoring to rival the magnesium light, for photographic purposes, by means of a mixture of phosphorus and nitrate of potash. He recently burnt a quarter of a pound of this mixture in his garden, at night, with a view to obtain a photograph of a wind engine which was being erected in an adjoining garden, and he states that "the length of time from when it was first lit until it was finally burnt out was nearly six minutes. The utmost cost was a fraction over fourpence. The reflection of the light might be seen for two miles around. So bright was it that the fire-engine authorities mistook it for an ordinary conflagration, and hurried their engines to the spot. Upon finding no trace of the fire they returned, rather chagrined, not, however, without first satisfying themselves by a thorough examination of the premises. All around appeared one blaze of light, the sky looked like a mass of fire." The picture taken during this startling illumination, "came out," we are told, "with great sharpness and vividness, the houses near being brought out prominently in, in fact, equaled any picture taken on a bright day."—*Mechanics' Magazine.*

Railroad Accidents in Massachusetts.—From the annual returns of the Directors of all the railroads in the State of Massachusetts, made to the Legislature, for the year ending Nov. 30, 1864, it appears that the whole number of passengers transported in the cars from Nov. 30, 1863, to Nov. 30, 1864, was eighteen million two hundred and six thousand and twenty-three, (18,206,023.) and of this vast number not a passenger in the cars was killed. Three persons in attempting to get on, and nine in passing from one car to another, or in jumping or falling off the platform while the trains were in motion, were killed or fatally injured. Thirty-one persons were killed during the year, while lying or walking on the tracks.

Auguste Larrison, a young workman, has invented a machine of extreme simplicity, intended for the fabrication of iron tubes by the application of centrifugal force. This machine is composed of a cylinder, opening and shutting at will, in which melted iron is poured. A rapid rotary movement digs through the liquid mass in the direction of the axis of the apparatus, while it forces it to adhere to the sides of the cylinder, and to assume its form. Refrigeration effects solidification, and by opening the cylinder a perfectly smooth and straight tube is withdrawn. The economy of this method is considerable, and homogenity is perfect. One is surprised that a method so simple has not been discovered and applied before.

A plan of preventing boiler incrustations, recently adopted in France, consists in lining the boiler with a metallic network at some distance from the sides. The theory is, that the lime salts will be produced upon this network, which can be easily removed, and from which the crust can be readily detached.

Improvement in the Giffard Injector by Mr. Turck.—As this instrument was originally constructed, the cylinder which receives the steam, its nozzle, and the needle which occupies its axis, slid together in the enveloping jacket when it was necessary to change the opening of the annular orifice by which the feed-water mixes with the steam. This arrangement requires two stuffing boxes. Mr. Turck removes these boxes, and renders the cylinder, nozzle and needles fixed, and avoids the contact of the cold water with the wall of the steam-nozzle, by interposing between the cylinder which receives the steam and the jacket a metallic piece surrounding the cylinder and its nozzle. This envelope alone is movable, and by its longitudinal motion closes or opens the annular space by which the feed-water enters. The Committee of the Society for the Encouragement of National Industry approve of the change, and publish the specification and drawing.

New Process for Hardening Timber.—The *Irish Farmers' Gazette*, of August 5th, contains the following:

A native of Russia has discovered a process by which timber, though newly felled, may become so hard as to resist the influences of the most trying climates for an indefinite period. The most curious part of the invention is, that it does not involve the use of chemicals of any sort, such as steeping in creosote, etc., and that the process is applied to the tree while growing. The inventor is now making arrangements for the supply of his timber to railway contractors in England, and will not require any remuneration further than the amount which should be paid for ordinary timber, until the period shall have elapsed beyond which the ordinary railway sleepers, telegraph poles, etc., require to be replaced. The railway sleepers require renewing at intervals of from four to six years; but the inventor of the new process of preparing timber asserts that he will supply an article which need not be disturbed for fifty years.

Hansbrow's Hydrostatic Engine.—The new quartz mill at Rocky Falls is completed. The motive power is one of Redding & Hansbrow's hydrostatic engines, and as many hopes and fears have been felt and expressed by the public as to the probable success of the experiment, we are happy to say the thing worked like a charm, and all that is now lacking is a little more water. Should the working of this engine prove a success, and there now appears no good reason to doubt it, it will prove an immense saving where wood is scarce and high.—*Gold Hill News.*

There are 250,000,000 lucifer matches daily consumed in England.

Sharp Financial Practice—The Romance of Insurance.

Perhaps the most singular specimen of an insurance company that ever existed was the "Plate-Glass Insurance Co." that flourished in London some twenty years ago. We doubt whether any of our California mining share operators ever played quite so sharp a game as that narrated below:

At the time alluded to, plate-glass of enormous dimensions was beginning to be brought into use for shop windows in the great thoroughfares, and these monster panes seemed especially to provoke the destructive propensities of that class of young bucks who were in the habit of "travelling" late, ringing bells, changing signs, breaking street lamps, and perpetrating all manner of mischief. To aggravate matters, it so happened, by some legal oversight, that the law making the smashing of windows a misdemeanor was so worded as to afford no protection to panes above a certain size. This furnished perfect immunity to joyhawkers in their attacks upon the largest and costliest show windows, and the shopkeepers suffered accordingly. But now a bright idea occurred to one of the most active and enterprising of the "destructives." He set to work among his companions and organized a "Plate-Glass Insurance Co." for the insurance of panes too large to be within the protection of the law. A room fronting upon a crowded street was taken, showy signs put up, and business commenced with all due formality. Meantime energetic outside measures were taken to lend an impetus to the business. The fashionable quarters of London were districted among the stockholders, and it was made the duty of each to devote himself zealously to breaking all the windows in his district not covered by the policies of the company. Under this able management, "the Plate-Glass Insurance Co." was soon floating on the top wave of prosperity, and business and money flowed so fast as almost to appall the stockholders. The losses were few and promptly paid, while the receipts were enormous and the public confidence in the company unbounded. It was in this condition of affairs that the directors sagaciously determined to avail themselves of the present smiles of fortune, and place themselves beyond the risk of her caprice. They had issued immense numbers of policies for a year; the premiums were already paid; every one likely to insure *had* insured; what then, was the use of continuing the expense of carrying on the business and risk of losses? These views met with the unanimous approval of the stockholders. A meeting was accordingly held, and the resolutions formally passed, dissolving the company and dividing the capital on hand. Thus terminated the existence of the "Plate-Glass Insurance Co.," after a brief but brilliant career of a few months. Its history is calculated to furnish a valuable moral for those who are capable of deriving a lesson from the experience of others.

Gold Mining in Wales.—About two years ago a number of companies were started with the view of working the auriferous quartz deposits discovered in several localities in North Wales, and such was the confidence entertained at the time in the success of Welsh gold mining, that capital was obtained without difficulty from the over-credulous public. The temporary success of the Vigra and Clogan mines was the great inducement to enter into these speculations, and the warning that appeared from time to time in the *Times* had little effect upon the investing classes. Among the companies formed were the Cambrian, East Cambrian, Welsh Gold Mining, Castell Carn, Dorchan, Dolfrwynog, East Clogan, St. David, and many others, and fully one-half the number are by this time either in course of winding up, or unable to proceed, owing to having spent the whole of their capital, and those that are still working show hardly any prospect of success. The Vigra and Clogan mine, which formerly gave such promising indications, has not paid any dividends for three years, which proves that gold mining in the Principality is a speculation in the widest sense of the term. Quartz containing a certain percentage of gold has been discovered at all the mines, but the cost of reduction has been far above the yield of pure metal, and hence the unprofitable character of the speculations, and until the mechanical appliances for extracting the gold from the quartz are more perfect and less costly than at present, gold mining cannot be successfully carried on in Wales.—*London Times.*

The scientific expedition to Brazil, under Agassiz, is chiefly to test his glacial theory, which is that at some past period a very large part of the earth was long covered with two vast caps of snow and ice, centered at the poles, lapping far down toward the equator, and in many parts 12,000 or 15,000 feet thick. He has already made some important discoveries substantiating his theory.

Mining Summary.

CALIFORNIA.

Nevada.—The attention of the Nevada county papers appears to be more particularly directed, at the present time, to the new Excelsior mines, in the upper portion of that county; hence, we suppose the reason that we are unable to gather our usual interesting summary of mining items from the papers of that county. We have before us a column or more of clippings, in relation to the Excelsior mines, from which we learn that considerable ore is being taken out and shipped to Grass Valley, for testing by the working processes employed there. The first shipment of rock from the Enterprise claim consisted of five tons of rock taken as it came from the ledge. The yield, as worked at the French mill in Grass Valley was $652, or $130.40 to the ton. The sulphurets, which assay $250 to the ton (after concentration, we suppose), have not been worked. The tailings are to be worked again, and it is thought they will pay about eighty dollars. This is the first mill test that rock from the new mines has been subjected to, and by this it is fully established that the mines are valuable.

The Confidence company, whose claims are located on the Pacific ledge, have sent four tons of rock, which was also worked at the French mill, and paid $53.50 per ton in gold. Another lot of ore was soon expected to arrive from the same locality. The Confidence have sunk their shaft to the depth of eight feet, where the ledge is seven feet wide. The rock appears to be of excellent quality, and looks very much like that taken from the Enterprise claim. The prospectors of Meadow Lake District seem determined to give their claims a fair test, and for this purpose the rock is taken from the ledges just as it comes and tested in the mills.

The Golden Age company, who claim the first south extension of the Enterprise lead, after much prospecting, have just found the ledge on their claim. The top rock is of the same character as that of the Enterprise, and promises to be equally as rich.

Extraordinary efforts are being made to give the mines of this district a fair test before the rains set in. The only item of interest which we have from the lower section of the county, is in relation to the well known Sneath & Clay mine, near Nevada, which has recently been purchased by an Eastern company, known as the New York and Grass Valley Quartz Mining Co. This mine is now under the management of S. P. Leeds, Esq., one of the best mining experts in the State, and under whose management we predict for it a brilliant success. The mine, we have understood, has been under bad management for some time past. The surface ore has been exhausted, without proper attention being paid to exploration for future work. The rock lately taken from the ledge, though not as rich as has been reported, contains sufficient gold to yield fair pay. At present the company is engaged in driving down the old incline, and it is the intention to sink it one hundred feet below the old works of Sneath & Clay—about four hundred feet in all—before running a level. The ledge lays quite flat, inclining at an angle of about twenty-three degrees; the lower level will only be about a hundred and thirty feet in perpendicular depth below the surface. A large Cornish pump for freeing the mine of water is run by a splendid 40 horse-power engine, the water being raised through a 10-inch pipe to the surface. The ore is raised by an engine of 20 horse-power.

Placer.—The *Stars and Stripes* says the people of Placer are beginning to awaken to the fact that it is not necessary to travel off to distant mining localities to find good paying quartz ledges. Capt. Mallet, an old and experienced quartz miner of Auburn, after prospecting extensively in Washoe and elsewhere, returned to his old home and after a little search has succeeded in striking a very promising ledge, which prospects well in both silver and gold. From the Green Emigrant and other ledges on Bald Hill, rock has been recently taken out nearly as rich and from better defined ledges, than the wonderfully rich specimens obtained last spring. San Francisco speculators have been on the hot scent in that vicinity of late, but the Green Emigrants are disposed to nurse a good thing when they find it, and are not disposed to sell for a mess of pottage. There is a rumor that the members of the Crœsus Company have allowed New York speculators to get the advantage of their want of capital and have sold their fine mine for the bagatelle of about $30,000. The same paper says there is every indication of a quartz furore in that vicinity.

WASHOE.

The depth and development of the principal mines of the Comstock lead, at the present time, is nearly as follows:

Ophir.—The lowest working level is 350 feet—Walsh shaft. Development, 600 feet.

Gould & Curry.—Lowest working level, 425 feet—Bonner shaft. Lowest development, 600 feet—D street shaft.

Savage.—Lowest working level, 365 feet hoisting shaft. Lowest development, 425 feet hoisting shaft.

Chollar and Potosi.—Lowest working level, 350 feet hoisting shaft. Lowest development, 300 feet hoisting shaft. New development shaft commenced at surface.

Yellow Jacket.—Lowest working level, 340 feet hoisting shaft. New shaft being sunk.

Belcher.—Lowest working level, 240 feet hoisting shaft. Lowest development, 440 feet hoisting shaft.

Hale & Norcross.—Lowest development, 550 feet hoisting shaft.

Crown Point—Lowest working level, 260 feet hoisting shaft.

Gold Hill Claims.—Average working level, 250@500 feet. Average development, 500@600 feet.

The California mine is alive once more. The parties who recently took this mine to work on shares have lately struck a splendid body of ore, some distance south of the old works, which, it is said, is very large. The *Enterprise* says of it: "As to the richness of the ore discovered there can be no doubt. Competent judges from other mines have pronounced it first rate. All old settlers know the tunnel through which it is brought. The ore is found within thirty feet of the surface. How far south it may extend, or how far down, is, of course, unknown. It is the body of ore for which the company has so long been looking."

The Hale & Norcross Company are engaged in sinking an air shaft to introduce fresh air to the bottom of the mine, 700 feet below the surface, where they have struck a body of excellent ore. As soon as the air shaft is down, the company will begin taking out ore.

The Savage Company, says the *Union*, have bought the Minnesota Mill, Washoe City, and will run it, hereafter, on ore from their mine. They have done well in the appointment of Captain L. Rawlings, formerly agent in this city for the California Stage Company, a gentleman of sound practical worth and good business capacity, as superintendent of the mill. He has already entered upon the discharge of his duties. The mill is an excellent one, of sixteen stamps, and will undoubtedly do good work, as it has done heretofore.

We learn from the Monitor *Gazette*, Alpine county, that the Monitor Consolidated Mining Company have a 105 horse-power water wheel, with all the machinery of a 25-ton mill now on its way over the mountains.

The Silver Mountain *Bulletin* notes that large quantities of ore are being shipped from the Morning Star mine, in the Great Mogul district, valued at $100 per ton. It is taken to smelting and reducing furnaces that are being erected at Oakland, Alameda county, because at present there are no suitable furnaces on the other side of the mountains.

HUMBOLDT.

The Virginia *Enterprise*, of the 11th inst., says that nineteen bars of bullion have reached Wells, Fargo & Co.'s office from Stevenson's mill, Trinity district, about 25 miles from Humboldt river, and adds: "We shall expect to see many such shipments from that region before next spring. Bullion always tells; talk is little heeded."

The Humboldt *Register* says that Wehber & Co. are preparing to build furnaces for smelting the argentiferous galena of Arabia. They will haul fire-bricks from Virginia, which will cost about 50 cents each at the mill. The two furnaces to be first built are intended to smelt about 10 tons of ore per day. This will make available large amounts of ore now of no value, for lack of the means to extract the silver.

The *Register* learns from Star City that work has commenced on the Whitmore tunnel. Men are also at work on the croppings, taking out minerals to be shipped to England, where the principal shareholders live. A contract has been let out on the American claim, on the Sheba belt. This company joins the American claim on the Sheba belt. The contracting parties have commenced work. The De Soto, Almira, American Basin, Yankee, and other claims, all at work.

The El Dorado mining district, located on the West side of the Humboldt mountains, proper, is beginning to receive some attention. It is described as being a very promising mineral region, well timbered, and abounding with water, affording most excellent mill sites. The oldest and principal location in the district is the Bonner ledge, which has been opened to the depth of seventy feet, exhibiting a fine 7 foot ledge of argentiferous galena, assaying from $60 to $200 to the ton. The same company has also opened another and very similar parallel ledge by a tunnel. Operations are now suspended for lack of capital.

The Armstrong Series is also situated in this district, and consists of ledges One, Two, Three and Four, lying well down the mountain side, some distance north of El Dorado Cañon. The company owns 3,000 feet on each ledge. The croppings are abundant, and show well in mineral.

REESE RIVER.

The *Reveille* apprehends that but few even of the citizens of Austin are aware of the extent and character of the work that has been undertaken and carried on in the Reese River region, under the direction of eastern capital. Whole districts have been surveyed and mapped; hundred of ledges in each have been examined and traced, and their character determined. Large numbers of descriptive specimens have been collected and properly classified to exhibit the character of the veins of silver, copper, tin and lead, which abound there, the value of which the *Reveille* thinks will eventually be incalculable.

The Union and Pioneer mills which have long been idle, are being put in a condition to resume work under the most favorable auspices.

A powerful steam engine for the hoisting works on the Stephen A. Douglas, on Lander Hill, arrived in Austin on the 9th instant and will soon be put in operation.

Several wagons containing the machinery and boilers for Hunt's mill at San Antonio, recently passed through Austin. The mill will be of the capacity of ten stamps, and will be erected at Indian Springs, seven miles from the location of the principal mines, where there is a plentiful supply of wood and water.

A new upright engine, with boiler and pump, have recently arrived at Amador, and are now in course of erection on the grounds of the Coral mine, at the mouth of Coral Cañon. A mill will shortly arrive for the same claim.

The Tessoro hoisting works are completed, and have been started up. The works comprise a building fifty feet in length by twenty-five wide, inclosing the boiler, engine, reel, and the mouth of the shaft. The boiler is a horizontal tubular, set in a brick arch. The engine is a very fine one of thirty-horse power, connected with the reel by friction gearing of the most approved style.

The *Reveille* has seen two bars of bullion which showed extraordinary work. These bars were from Phelps' mill at Big Creek, under the superintendence of C. S. Coover. The ore from which this bullion was obtained was taken from the Ethan Allen, which is full of base metal, and of course requires roasting; and although the amalgamation was in iron pans, the bars are 962 and 970 fine. The bullion from this process does not ordinarily exceed 700 fine.

Columbus district lies twenty-five miles north of Austin. It was discovered the past summer, and up to this date about thirty ledges have been recorded. The Mount Maria Company has located four ledges, named the Hale Great Eastern, Real del Monte, and New York; also a mill site and timber land. The ledges in the district are generally large, varying from three feet to ten feet in thickness, and several of them that have been worked exhibit good chloride ore on the surface. The water from Boone Cañon is sufficient for several mills. Timber is very plentiful in the neighborhood, and excellent and nutritious pasturage is abundant. The Mount Maria Company has had a fine map executed, showing the position of their locations.

Terrible Foundery Accident.—A terrible accident occurred at the foundery of Essler & Co., South Brooklyn, N. Y., on the 19th ult., by which two men met with a most horrible death. They were engaged in carrying a large iron crucible containing two hundred pounds of molten iron, which was intended for a heavy casting, and before reaching the bed-plate which directs the metal into the mould, the handle of the crucible broke and the contents scattered in all directions, covering the limbs of the unfortunate men up to the knees, absolutely roasting the flesh completely from the bones. The sufferers were removed to their residences in a state of suffering beyond the power of human nature to endure, and died in a few hours afterwards.

The California Stage Company appear to be contracting their field of operations to some extent. According to the Nevada *Transcript*, the company, within the past few months, have sold several of their most valuable routes, and negotiations are now pending for the sale of others. The only routes now owned by the company are those which terminate in Marysville. The California Stage Company is one of the oldest transportation companies in the State, and at one time controlled almost the entire travel of Northern California. Its affairs were managed by men of energy and enterprise, and whenever business would warrant, its lines were extended. The traveling public always found gentlemanly agents and accommodating drivers along its lines. Whatever may be the future of the company, it will long be remembered as one of the institutions of the State.

Sugar from Sorghum.—The question of obtaining sugar from sorghum has been fully solved by Mr. Jonas Hoover, of Mahaska county, Iowa. The sugar is said to be light, with a lively grain, and dry, equal in every particular to a good article of New Orleans. Mr. Hoover has taken out a patent for his process.

Later from Australia.—By the arrival of the Lubra, 72 days from Newcastle, New South Wales, files of Sydney papers to August 9th have been received. They contain little news of general interest. The colony appears to be in a thriving condition. The receipts from the gold mines are large, and several new strikes of auriferous ledges are reported.

Crosby & Thompson are hurrying up their new machinery in Colorado, says the Colorado papers, so as to get it running this Fall. At the Manhattan Mill, their desulpharizing machinery is also being erected. Before Spring it will have been thoroughly tested on the various ores of that region.

Thrilling Scene—A Train of Cars Running Through Burning Woods.—On Sunday, while the fire in the woods at Cedar Swamp was at its hight, an extra train of sixteen cars, bringing the Fourteenth Maine regiment, on their way home to Augusta, came over the Eastern Railroad. On either side of the track the flames rose forty feet high, the noise drowning the sound of the train. It was a fearful sight to behold. The oil on the wheels took fire, and along the train were seen revolving wheels of fire, while the seven hundred officers and men of the gallant Fourteenth were nearly smothered in the dense smoke. Fortunately the long train drawn by the "Cape Ann" went through the terrible ordeal without accident, and as the cars emerged beyond the burning district, the smoke rushed from the car windows into the air, giving an appearance of a train on fire.—[*Portsmouth (N. H.) Chronicle, Sept.* 10.

The Bureau of Rebel Archives, under the charge of Dr. Francis Dieber, is now at work upon the examination and classification of the five hundred boxes of archives of the late rebel Government. These documents relate to every department and period of the rebellion, and cover the larger part of its civil and military history. The title of the bureau has been changed to the Archive Office of the War Department, and the office will be permanently established in Ford's theatre building, as soon as the necessary alterations can be made, which will be done by the first of January.

The Webster Family.—The only person left to perpetuate the family name of Daniel Webster is his grandson, Ashburton Webster, a son of Fletcher Webster, who is a very promising young man now in the American navy. Fletcher Webster left two sons and a daughter, the last still living. Edward Webster, Major, who died in Mexico, left no children. There are four other grandchildren by his much beloved Julia, bearing the name of Appleton. This is all of the family of Daniel Webster.

Del Monte Again.—E. P. Atkins, of San Francisco, sues Alex. Gamble for $13,000, on some matter growing out of the Real Del Monte affair. It will be recollected that Gamble was President of the company and Atkins superintendent of the mine, at the time of its collapse.

Singular if True.—Six years ago a lady in Norwich planted three peach stones in a box. Only one of them came up, but now from the three branches of the tree she is gathering three different varieties of peaches.

The iron interests of the country were never more prosperous than at the present time.

Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, Oct. 21, 1865.

OIL PROSPECTS IN HUMBOLDT COUNTY.

Although no large amount of oil has yet been struck in Humboldt county, enough has been reached, in at least one locality, to make that a paying property. There are now fully twenty-five wells in progress, of which some seven or eight have more or less oil, which can be obtained by pumping. No well, we believe, has yet been sunk to the depth of 225 feet, at which depth neither a flowing or good pumping well is looked for with any degree of confidence in the Eastern oil regions. The lack of suitable transportation will for a long time yet continue to operate very unfavorably for the Humboldt region. In addition to the lack of roads to reach the seaboard, the steamer Del Norte now refuses to receive oil freight for the reason that such cargo vitiates her insurance policy. These difficulties cannot be overcome until a large aggregate of yield has been reached, and other means than those at present at command are devised for getting the oil to market. When that time arrives (and the indications of its near approach are even now abundant and constantly accumulating), the oil districts of Humboldt county will develop an amount of wealth in the petroleum interest which will bear a favorable comparison with the richest oil regions of Pennsylvania or Virginia.

The oil from Humboldt county is worth nearly double, in its crude state, that which reaches this city from the lower coast. As an evidence that there is even now money in the business, we will cite the following facts which we have upon reliable authority. The Union Mattole Company recently made a shipment of of oil to this city, with the following result:

	Cost per gall.
Cost of pumping	1 cent.
Cost of barreling	8 "
Freight to Centerville	4 "
Freight thence to San Francisco	4 "
Incidentals	3 "
Cost of oil in this city	20 cents.

Stanford & Bro. offered $1 per gallon for that oil on the wharf in this city—giving a net profit of eighty cents per gallon, or about $25 per barrel, for the crude oil. Neither the Gould & Curry or Ophir, in their palmiest days, ever paid anything like such a profit on the labor invested in extracting the precious metals. It should be remarked, that the above results have been obtained at a time when the price of oil is at an unusually high figure; yet, leaving a fair margin for all drawbacks, the evidence is accumulative of the fact that, even under existing circumstances, a pumping well, producing not more than eight or ten barrels per day, is a paying investment.

Letters from the Mattole Petroleum company's well, located between the Noble and the Union Mattole, received in this city the past week, express the greatest confidence in the success of that well. They are now down 173 feet, and have obtained a very fair flow of oil. They are still going down, counting confidently on a heavier flow by the time they reach 200 feet. The Noble well, as is already well known, has oil in paying quantities.

At last accounts, the Union had forty barrels of oil at Eureka, awaiting shipment by sailing vessels, as the Del Norte refused to receive it, for reasons already stated. Other shipments will follow as fast as circumstances will permit. There is every reason to believe that the amount of oil offering will soon be sufficient to warrant the investment of the necessary capital to secure regular, cheap and prompt transportation.

PICTURED ROCKS.—A gentleman just in from Excelsior, states that about half a mile south of Summit City are an immense number of large granite rocks completely covered with hieroglyphics. These are deeply cut into the solid rock, as though done with a chisel. There are pictures of men and animals, birds and beasts, and of various warlike weapons, with many lines and signs difficult to be understood. These pictured rocks extend for a distance of two or three miles in a line running east and west. Our friend made drawings of many of the most striking pictures he saw, but they were unfortunately left behind in Summit City. The hieroglyphics must have been cut by a race of people much superior to the Indian tribes at present found in California.—*Virginia Enterprise.*

We have seen several specimens which have been carefully cut out from those "pictured rocks," also a number of drawings from the "pictures," reduced in size from the originals, made upon the spot by a competent artist. These sculptures are very similar in character to the rude drawings made to this day by almost all the Indian tribes which inhabit the the country between the Pacific Ocean and the Mississippi River, being simply rude pictures of Indians—male and female—with the more common animals, such as bears, deer and rabbits; also birds and warlike weapons. A gentleman who is well acquainted in that region, and who has paid considerable attention to to these pictures, informs us that they are evidently of various ages, from so far back that they are almost obliterated by the action of the elements, down to those showing fresh marks of sculpture—such as *must have been made within the past year!* In fact, his opinion is that they have been made by the present Indians inhabiting and visiting these regions, and their immediate ancestors. It is possible that they may constitute a record of their history, or perhaps a memento of their annual visits there; for it is not a place of their continued abode, being too near the perpetual snow line for such a purpose. Possibly the inscriptions may be made simply as a means of passing away the time, or perhaps from the same motive of notoriety which prompts thousands of white men to carve or inscribe their names in various places much frequented by travelers in many parts of the world. This desire for cheap notoriety appears to be common to white men everywhere, and we see no reason why it may not be also common to the red man. Probably if the inquiry was made of any member of a tribe which is in the habit of visiting the locality of these newly-found "pictured rocks," some reliable information might be obtained which would take away from them the charm of antiquity with which, in the minds of some, they are now invested.

THREE STEAMERS.—The Pacific Mail Steamship Company will soon begin running three steamers per month as of old. This would indicate that travel is increasing between New York and San Francisco. The steamers will leave San Francisco in the following order: One on the 10th, 20th, and 30th of every month. The Golden City, which left on Wednesday last, carried away 998 passengers and $1,661,565 in treasure. The opposition steamer, which sailed on Thursday of last week, also left crowded with passengers to its utmost capacity.

Some dogs recently encountered and killed a porcupine near Placerville. It is a rare animal in California. The lips and mouths of the dogs were stuck full of its quills.

The Great Earthquake of New Madrid.

The greatest recorded earthquake, within the limits of the United States, occurred in New Madrid, then a small village upon the Mississippi, since in the State of Missouri. The agitations of this terrible convulsion commenced at 2 o'clock on the morning of the 16th of December, 1811. The inhabitants were aroused from their slumbers by a deep rumbling noise, like heavy thunder in the distance, accompanied with a violent vibratory movement of the earth from the southwest to the northeast, so violent at times that the people were unable to stand upon their feet without holding on to something for support.

It was dangerous to stay in their dwellings, for fear they might fall and bury them in their ruins; it was dangerous to be out in the open air, for large trees would be breaking off their tops by the violence of the shocks, and continually falling to the earth, or the earth itself opening in dark, yawning chasms, or fissures, and belching forth muddy water, large lumps of blue clay, coal, and sand, and when the violence of the shocks were over, moaned and slept, again gathering power for a more violent commotion.

On this day twenty-eight distinct shocks were counted, all coming from the southwest and passing to the northeast, while the fissures would run in opposite direction, or from the northwest to the southeast.

On a small river called the Pemiseo at that time, stood a mill owned by a Mr. Riddle This river blew up [such is the expression used by the narrator] for a distance of nearly fifty miles, the bed being entirely destroyed, and the mill swallowed up in the ruins, and an orchard of ten acres of bearing apple trees, also belonging to Mr. Riddle, nearly ruined. The earth, in these explosions, would open in fissures from forty to eighty rods in length, and from three to five feet in width; their depth none knew, as no one had strength of nerve sufficient to fathom them, and the sand and earth would slide in, and water run in, and soon partially fill them up.

After the earthquake had subsided there was not a perfect row of trees left in this orchard—one-half destroyed, some leaning in one direction, others directly contrary; some covered to the limbs in these chasms as they filled up, and others with their roots turned entirely out of the earth.

Large forest trees which stood in the track of these chasms would be split from root to branch, the courses of streams changed, the bottoms of lakes pushed up from beneath and form dry land, dry land blow up, settle down, and form lakes of dark, muddy water.

Where the traveled, beaten road ran one day, on the next might be found some large fissure crossing it, half filled with muddy, torpid water. It was dangerous to travel after dark, for no one knew the changes which an hour might effect in the face of the country, and yet so general was the terror that men, women, and children fled to the highlands to avoid being engulphed in one common grave. One family, in their efforts to reach the highlands by a road they all were acquainted with, unexpectedly came to the borders of an extensive lake; the land had sunk, the water had flowed over it or gushed up out of the earth and formed a new lake. The opposite shore they felt confident could not be far distant, and they traveled on in tepid water, from twelve to forty inches in depth, of a temperature of 100 degrees, or over blood heat, at times of a warmth to be uncomfortable, for the distance of four or five miles, and reached the highlands in safety.

On the 8th of February, 1812, the day on which the severest shocks took place, the shocks seemed to go in waves, like the waves of the sea, throwing down brick chimneys level with the ground, and two brick dwellings in New Madrid, and yet, with all its desolating effects, but one person was thought to have been lost in these commotions.

The morning after the first shock, as some men were crossing the Mississippi, they saw a black substance floating on the river, in strips four or five rods in breadth by twelve or fourteen rods in length, resembling soot from some immense chimney, or the cinders from some gigantic stove-pipe. It was so thick that the water could not be seen under it.

In the Mississippi river, about five miles above what was then called the first Chickasaw Bluffs, but in later times Plum Point, was an island about three miles long, covered with a heavy growth of timber, which sank in one of these shocks to the tops of the trees, which made the navigation extremely dangerous in a low stage of the river.

About four miles above Paducah, on the Ohio river, a large circular basin was formed, more than one hundred feet in diameter, by the sinking of the earth, how deep no one can tell, as the tall stately oak sunk below the tops of the tallest trees. The sink filled with water, and continues so to this time.

For one whole hour the mighty current of the Mississippi was turned backward towards its source, until its dammed-up waters were able to break through the barrier; boats were dashed to pieces and drifted about like feathers, or thrown out on the banks, while amid the awful commotion loud rumblings were heard, and the electric fires flashed up and down and every way through the air. A few years ago it was said that forests and cane-brakes were still visible at the bottom of lakes then formed. The devastation extended over a tract of country three hundred miles long, from the mouth of the Ohio to the St. Francis river. In some places mud and water were thrown over the tallest trees, and great fissures broke in the ground, running uniformly from the northeast to the southwest. The people observing this, cut down trees at right angles with the direction of the fissures, and climbing thereon, escaped being engulfed. Hundreds of these chasms were discovered seven or eight years after the calamity; and as late as 1846, they still appeared like artificial trenches dug by some great army. They were generally parallel, and ranged from ten to forty-five degrees west of north. The region is still called "The Sunk Country," and its extent along the White Water is some eighty miles north and south, and thirty miles east and west. Humboldt remarked that as one of the most wonderful convulsions known to history, since the vibrations continued through several months, and finally culminated in the destruction of Caracas.

AYER'S DESULPHURIZING PROCESS.

EDITORS MINING AND SCIENTIFIC PRESS—*Gentlemen:* In your issue of 22d July, I find some statements, under "Revolution in Mining," which are erroneous in fact and prejudicial to me. Knowing that you can have no motive or wish to mistate, injuriously to me, I beg to submit the following facts:

I have discovered the means of disintegrating rock, cheaply rendering it friable like chalk. I have verified it upon laboratory quantities of almost every variety of stone, until the results are indisputable. The process and its results have been examined by the eminent chemists you name, Drs. Hayes, Silliman and Torrey, and what they state, in writing, is published verbatim. Further and larger experiments more than sustain all they say.

The use of my discovery to mining interests is obvious; but its reduction to use, and its practical administration, being more than I could undertake, I transferred my interest to a company of gentlemen who would develop and carry it into practical use. They have able engineers engaged upon the furnaces and appliances required, with reasonable expectations of having them soon perfected for the reduction of ores. We shall not "revolutionize mining" in a month, and only too sanguine men have expected it; but that we shall supply greater facilities for the extraction of metal from their ores, and important advantages to mining interests, I firmly believe. As to deceiving anybody, we have no motive for that, even if we were base enough. The company ask nothing of miners but a portion of the increased yield which their process affords. I receive not a dollar from the company, except some portion of its income, which it can only have when it has rendered valuable aid to mining interests. That the reporter of an Eastern paper, who knows nothing of mining, should fail to state with technical accuracy a mining problem, you can well enough believe; but that either the *Tribune's* article or the company's publications willingly misstate anything, I beg you to disbelieve. I know my associates, as well as myself, would feel sincere regret if any overstatement of what we can do should obtain publicity through us.

Early in summer the company believed themselves ready for operations and advertised accordingly, but their plans of furnaces were soon found impracticable for tropical climates, because the heated ore must be moved by hand. They are now building, for experiment, furnaces of an automatic character, in which no handling will be required, and which I do not doubt will accomplish our purpose easily and cheaply. Be that as it may, you may rest assured of one thing, and that is my process does disintegrate rock, certainly, effectually, cheaply, and will continue to do so, until the laws of matter change.

As soon as the company can perfect the required appliances, it will offer them, with its rights and royalties, through the proper channel of mining information. To those who feel

restive under the seeming delay, permit me to say, that the company is using all the means in its power, and will hasten to reduce my discovery to practical use at the earliest possible moment, and present it for the adoption of miners everywhere, as soon as possible.

J. C. AYER.

Lowell, Mass., Aug. 28, 1865.

The above letter fully explains itself. What we said in the article referred to, in relation to Professor Torrey, we stated on the authority of a mutual friend, who assured us that he had it from the professor himself. Both gentlemen are now at the East, and we give all parties concerned the benefit of Dr. Ayer's communication.

So far as the certificates of "Drs. Hayes, Silliman and Torrey" go, they refer merely to a laboratory process—the treatment of small quantities of ore; and prove nothing with regard to the value of the discovery as a mill process. Dr. Ayer, however, assures us in the above communication, that "further and larger experiments more than sustain all they say." But the further fact which the Doctor states in his letter, that the company "have able engineers engaged upon the furnaces and appliances required, with *reasonable expectations of having them soon perfected*," would seem to imply that the process has not yet reached a success. It appears, however, that experiments are still in progress; and we sincerely hope that the most sanguine expectations of the company will be more than realized. The Doctor rightly judges that we can have no motive to misstate him, or place any hindrance in the way of experiment or progress in this direction. We can assure him, and all other parties concerned, that we shall be especially happy to announce any satisfactory result, coming from any source, which shall tend to simplify or cheapen any of the processes of mining. Our only object was to place miners on their guard against what we yet consider extravagant figures and calculations with regard to the supposed results of this process. Don't publish your figures, gentlemen, until they have been verified by practical results. The people of California have already suffered quite too much by misplaced confidence in assumed results. Facts are what we want, and not figures.

THE corn crop of California, for the present year, has been unprecedently large. The same is true of the country at large, according to the report of the Commissioner of Agriculture.

LEAD MINING IN MISSOURI.—The owners of the celebrated lead mines in southern Missouri are building new furnaces, and preparing to employ about 1,500 miners in taking out lead.

Traveling Agent.

MR. ROBERT LATTIMORE is now on a canvassing tour for the PRESS through Butte, Colusi, Tehama, Shasta, and Siskiyou counties, and we recommend him to the favorable consideration of our friends.

OUR NEW YORK AGENCY.

MR. GEO. M. NEWTON is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "STOCKHOLDER," **No. 72 William street.**

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerns ing the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

DEWEY & CO.,

4v11 Office Mining and Scientific Press.

QUARTZ OPERATOR'S HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,

Authors and Publishers.

BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on page 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

New Volume

OF THE

Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).

PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Prin

505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

THIS COMPANY OPENED THEIR SALESROOM ON Monday, 16th inst., with a large and carefully selected stock of rich goods, consisting of fine gold and diamond-set Watches and Jewelry; Silverware and Silver-plated ware; Pianos; superior Bronze and Ormolu Clocks; Statuettes; valuable Oil Paintings; Bronzes; high cost porcelain Dinner and Tea Sets; Venetian, Bohemian, French and American Cut Glass, in full sets; richly decorated Vases and Mantel Ornaments; Fans, Opera Glasses, Albums, and elegant Fancy Goods in every variety.

The public are respectfully invited to examine this collection of valuable merchandise and works of art. Retail prices have been placed at wholesale rates, and every style of goods will be sold at a small per centage on cost of importation.

16v11-1t **F. A. GETZE, Secretary.**

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,

Publishers Mining and Scientific Press.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

To Blacksmiths.

An excellent, strong lad, from the interior, 17 years of age, desires to learn the Blacksmith's trade. His parents wish him to engage with a reputable firm, and learn his business thoroughly. Address, or inquire at the office of the MINING AND SCIENTIFIC PRESS. 12v11tf

INTERESTING FOSSIL REMAINS.—The tusk of a fossil elephant was found recently, near Brattleboro, Vermont. It is forty-four inches long and eighteen inches circumference at the larger end, and is in good preservation. This tusk belongs to a species supposed to have been extinct in the earlier periods. The creature is known to naturalists as the *Elephas Primogenius Blumenbach*, formerly inhabiting the northern part of this continent, having wandered across the Siberian plains to the Arctic Ocean and Behring Straits, and thence south to about the fortieth parallel. The animal was about twice the weight and one-third taller than the modern species. The remains of one of these gigantic creatures were found on the summit of Green Mountain, at Mount Holly, in 1818.

The foregoing is especially interesting here, because remains of a similar character are in possession of the Historical Society at Sonora, Tuolumne county. That region has been wonderfully productive of fossil remains, though most of the tusks and bones discovered there have belonged to a smaller species. We think, however, that the venerable Dr. Snell, the President of that Society, informed us that he was also in possession of remains of the fossil elephant, and the object of this paragraph is to obtain the satisfactory and valuable information which he is capable of giving to the public.

IRON BARRELS.—A correspondent at Detroit says that a citizen of that place has obtained a patent for an iron barrel which will be just the thing for petroleum. It weighs sixty pounds and with proper machinery a man can turn out ten or twelve per day.

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Machinists and Foundries.

H. J. BOOTH. GEO. W. PRESCOTT. I. M. SCOTT.
UNION IRON WORKS!
Corner First and Mission streets,
SAN FRANCISCO.
ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.
Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.
Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.
Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wahlee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,
Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.
We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron.
All work done in the best manner at the lowest cash prices.

Miners' Foundry
—AND—
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as
Steam Engines and Boilers, Flour, Saw and Quartz Mills,
Machinery, Mining Pumps, Amalgamators,
Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.
*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, FREE OF COST.
All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.
HOWLAND, ANGEL & KING.

Vulcan Iron Works Company
[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.
IRON FOUNDERS,
Steam Engine and Locomotive
BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.
The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as
Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Flouring Mills,
Locomotives, Quartz Mills,
Car Trucks, Sugar Mills,
Car Wheels, Saw Mills,
Housings and Irons; and
Manufacturing Machinery of Every Kind.

Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR.
BEATH'S AMALGAMATOR;

ALL KINDS OF BRASS AND COMPOSITION CASTINGS AND FINISHING DONE WITH NEATNESS AND DISPATCH.

CHURCH AND STEAMBOAT BELLS, OF ALL SIZES, made to order. Engineers' Gongs made and hung in the best manner. Bank, Vault, Store and Prison Locks; also Brass Padlocks and Shop Locks of various patterns, on hand and made to order.
☞ Particular attention given to casting Rudder Braces and Slip Work in general.
☞ All Jobs promptly attended to. Prices moderate. ☜
No. 125 First street, opposite Minna next door to Pacific Foundry. 12tf
[Removed from Oregon street, between Front and Davis.]

FACTS.—It is now well ascertained that most of us eat twice as much as we need, and that ninety out of a hundred diseases are our own making. The gentlemen who whirl about all day in their carriages as if they were rushing to put out a fire, passing from house to house to minister to people afflicted with colds, bilious attacks, headaches, nervous complaints, gout, rheumatism, and the majority of physical ills that afflict humanity, owe their occupation and its profits to the wrongs of the stomach. People treat that vital member, which prepares in its wonderful labratory the streams of life that nourish the whole system, as if it was merely a convenient arrangement for the gratification of the palate and the appetite. As a rule, they don't even take the pains to lighten its labor by making their teeth do the rough part of the work, but bolt their feed, gobbling away as long as a cubic barley-corn of the stomach is left uncrammed. They convert it into an organ of sensual enjoyment, forgetting that its office is to prepare supplies to repair the hourly waste of the body, and that, as these supplies are healthy or unhealthly, so will the body be.

THE vintage is said to have totally failed this year in Hungary.

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11-3m

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

And in accordance with law, and an order of the Board of Trustees, made on the 4th day of September, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the Secretary, 305 Montgomery street, San Francisco, by Olney & Co., auctioneers, on the 27th day of October, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. S. LUTY, Secretary.

Office, 305 Montgomery street, San Francisco, Cal. oc7

A VINEGAR MAKING ANIMAL.—Foremost among the fasbionable arrivals in Paris must be recorded those of a couple of curious creatures from China. They are now receiving company at the Jardin d'Acclimatization. One is a tortoise, or small turtle, with green hair flonting out from under his shell. The otber creature is a hideous, revolting-looking polypus, endowed with the peculiar nttribute of making vinegar. This remarkable monster is tbus described:

"The Tsoundodyde is deserving of particular mention from its power of making vinegar. The polypus is a monstrous assemblnge of fleshy membranes and glutinous tubes, and a mass of mis-shapen nppendages, which gives it a revoltiug and hideous aspect. You will suppose it to be lifeless, but, if you touch it, it writhes and assumes various forms, proving its vitality. The structure of this creature is but little known."

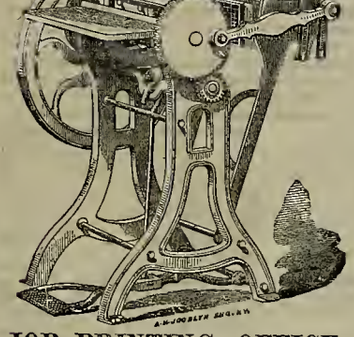
COAL is more plentiful in the United States —and more expensive—than in any other country.

STILL PROGRESSING!

THE OFFICE OF THE

Mining and Scientific Press

was removed, April 8, to the old printing stand lately known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets (one block south of our former location), where we have consolidated with a



JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for

CHEAP, RAPID AND FINE PRINTING.

We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,
BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.

City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

E. D. WATERS, JR., C. W. M. SMITH, } Proprietors. { W. B. EWER, A. T. DEWEY,

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINing Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almadon Quicksilver Mine, in this State. The best of reference given on application at this office.
San Francisco, Oct. 12, 1865. 15v11tf

"Patent Paper Reel for Telegraph Register."

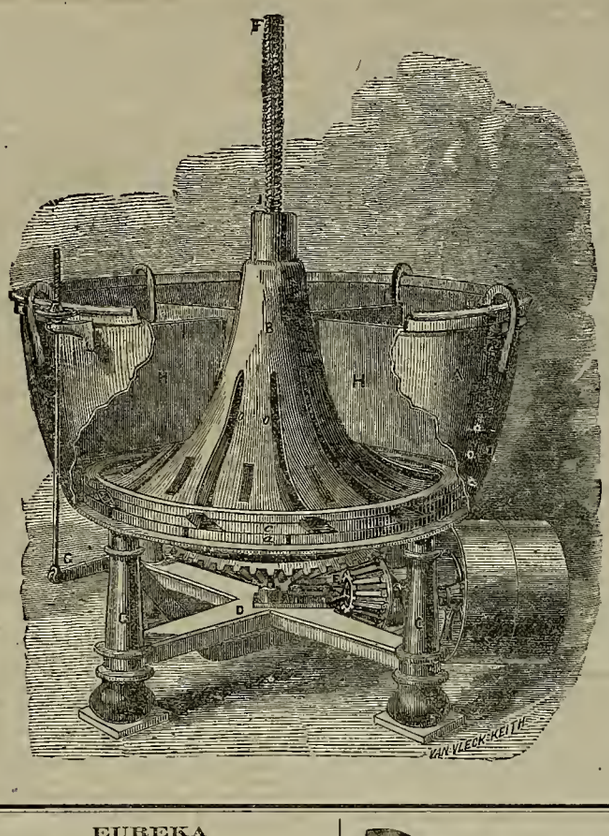
SAN FRANCISCO, Sept. 18, 1865.

EDS. MINING AND SCIENTIFIC PRESS—*Sirs:*—Having noticed the above heading in your valuable paper of the 9th inst., I beg leave to inform you that the invention is not Mr. L. W. Worth's, but one already patented by me, while a resident of Cleveland, Ohio. His form of reel is one that I first got up in 1863, and filed a caveat for, and afterwards improved by putting some gearing, or clock machinery, so as not to use so much cord. The length of cord that I use now to run all day, would not run his reel one hour. After making my improvement, I applied for a patent, which was granted to me on the 19th of January, 1864. That patent covers all of his, so-called, improvement, as will be seen by my patent (No. 41,312) which claim reads as follows:

"What I claim for my improvement, is the arrangement of the mutually exchangeable reels D and F, in combination with the gears, cord, pulleys, and weight, the several parts being constructed, arranged, and operating as and for the purpose herein set forth."

This patent was obtained for me by Messrs. Brainard & Burridge, of Cleveland, Ohio, Patent Solicitors. And I further state, that all persons wishing to use said Paper Reels, will please to come and make arrangements with me for their use. As for my advantage he has over other reels, it can only be that he has a greater length of cord to to wind up. Those that I built, of his style, before I had mine patented and after I filed a caveat, had all to be exchanged for my new reel. In putting this up it takes only six screws to do the whole business, and takes up so little room that it is quite a convenient and useful instrument.

Address, HENRY McGANN,
12v11 At the Union Works, First st., San Francisco.



THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Traetory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Traetory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

Where Fat and Flesh Come From.

They come from the earth and the atmosphere, collected by vegetation. Grass contains flesh; so grain. The animal system puts it on from these. Vegetation then is the medium through which the animal world exists; it can exist in no other way. When grass or grain is eaten, the flesh constituents are retained in the system; so also the fatty substance, that is, the starch and sugar, from which fat is made. Some grains have more flesh than others; so of the qualities that make fat. In a hundred parts of wheat, according to Piesse, are ten pounds of flesh; in a hundred parts of oatmeal, nearly double that amount. Hence oats are better for horses, on account of their flesh-forming principle, rather than fat, as muscle is what a horse wants. For fattening purposes, however, corn and other grains are better.

When flesh itself is eaten, the system but appropriates what is already formed, but would as readily take it from vegetables, from flour.

The flesh-making principle—or the flesh itself, in its constituents—goes to form cheese in the dairy; the starch, &c., butter. Hence it is that some people assert that cream has little influence in cheese, farther than to enrich it; for cheese and butter are entirely distinct. The same kind of food is equally good for the production of either. This is a point of considerable interest, and is not yet fully explained—indeed, it is yet in its infancy. And a plant in its different stages of growth has a different effect. The fat of the plant is held in reserve for the seed; nothing is wasted in leaves, wood, &c.; the precious seed must have it. Hence when this takes place, the stalk is comparatively worthless to what it is prior to the change. And the fat cannot be appropriated so well in the seed as when it is diffused through the stalk. Tender herbage, therefore, is the best; and when secured before the direction of the oil takes place, so much the better will be the hay.

CASUALTIES.—Three thousand one hundred and eighty-one persons lost their lives, and nine hundred and thirty-five other persons suffered bodily injuries, by accidents upon American railroads or steamboats, or by explosions of powder magazines, or fall of buildings, in America, during the period between the close of the war and the 31st of August—just five months. These figures, supposing the entire year to present a similar record, would give a total of 7,632 deaths, and 2,244 persons wounded, within the space of twelve months.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

Machinery.

Worth's Telegraph Reel.

MESSRS. DEWEY & CO.—Dear Sirs: I see a notice in your paper in regard to my Paper Reel, signed Henry McGann. All I have to say is, if I had invented such a Reel as his, in 1862 or 1863, and had not improved it more than he has, I would keep my name to myself, and not let the public know who I was. His notice puts me in mind of Shakspeare's play of "Much Ado About Nothing." My Reel is entirely different from his, and is considered, by operators who are judges of such things, to be the best; and as for the cord, I could rig one to my Reel that would run a week, but it is not necessary.

For the best Paper Reels, address

L. W. WORTH, Sonoma,

15v11tf Or, WM. LUNDBERG, San Francisco.

HUNTER'S PREMIUM CONCENTRATOR, AMALGAMATOR AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste tioe gold and amalgam is amalgamated on the copper plates; no trace of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,

15v11-3m Or to E. T. STEEN, Agent.

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for preparing simular results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 9th.

504] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1861; his Crocodile Quartz Crusher; his Pulverizer; and his improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

24v9

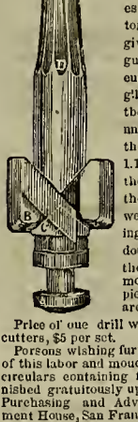
ATTENTION, MINERS!

LINSCOTT'S PATENT CHAMBER DRILL.

Great Improving in Blasting.

W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.



D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ⅛ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force alide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1⅜ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished without charge upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

JOHN MAILER,

Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco.

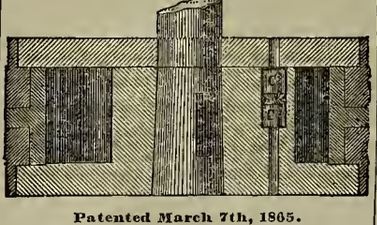
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

STOW'S PATENT CHAMBER DRILL.

The greatest Labor-saving Machine ever invented for Quartz Mining. By using this Drill in shafts, tunnels, and all other rock blasting, three-fourths of the labor and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 2½ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, September, 1865, a Committee, after examining both the Lincoln and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for blasting rock, for the following reasons:

1st. For simplicity of construction;
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for **$30**, with one set of Cutters or Chisels that will chamber from 75 to 150 holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 7 Government Block, corner Sansome and Washington streets, and at No. 511 Market street.

Drills will be delivered to any part of this State free of expense to the purchaser. Any information desired, or orders for Drills, address

STOW & COLLINS,
San Francisco.

Oil Wells! Oil Wells!!

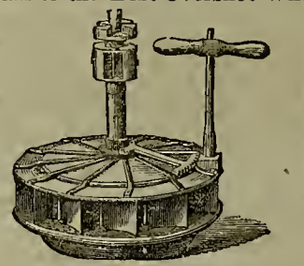
I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ¼ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to and work with any common drill at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

HENRY M. STOW,
14v11 San Francisco.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED



IN EXISTENCE.

LEFFEL'S AMERICAN DOUBLE TURBINE,

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 20½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,

At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

SALMON'S PROPELLOR AMALGAMATOR — AND — Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 **J. & W. C. SALMON.**

OIL WELL BORERS.

A CONTRACT WILL BE LET TO A RESPONSIBLE party to sink an Oil Well, as deep as may be required, on land belonging to the "Eel River Oil Company," situated in Humboldt county, Cal. For particulars, inquire at the office of the Company, No. 436 Jackson st., up stairs.

BAUX & GUIOD S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Hengh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

AGENTS WANTED
—FOR—
The Secret Service, the Field, the Dungeon, and the Escape.
—BY—
ALBERT D. RICHARDSON,
N. Y. Tribune Correspondent.

1,000 COPIES SELLING PER DAY!

The most interesting and exciting book ever published, embracing Mr. Richardson's unparalleled experience for four years. Travelling through the South in the secret service of the "Tribune" at the outbreak of the war, with our armies and fleets, both East and West, during the first two years of the Rebellion; his thrilling capture; his confinement for twenty months in seven different rebel prisons; his escape, and almost miraculous journey by night of nearly 400 miles. It abounds in stirring events, and contain more of the fact, incident, and romance of the war, than any other work yet published. Horace Greeley says of it:

"A great many books will yet be written concerning this war, in addition to the many already in print; but not one of them will give, within a similar compass, a clearer, fuller, more readable account, entirely from personal observation, of the nature, animus, purposes, tendencies, and instrumentalities of the slaveholders' rebellion, than does the unpretending narrative of Mr. Richardson."

Teachers, ladies, energetic young men, and especially returned and disabled officers and soldiers, in want of profitable employment, will find it particularly adapted to their condition. Send for circulars. Address

AMERICAN PUBLISHING COMP'Y,
Hartford, Conn.
SCRANTON & BURR, Agents. 14v11-4t

Pacific Mail Steamship Co.

The following Steamships will be dispatched on the following named days.

October 30—COLORADO.....Capt. Jas, T. Watkins

From Folsom street Wharf

At 11 o'clock A. M., punctually to the hour,

For Panama.

Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York by the Atlantic and Pacific Steamship Company

A Baggage Master will be sent through each trip.

Cabin passengers will be berthed for Atlantic steamer.

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA BUILDING,
No. 548 Clay street, near Montgomery, San Francisco

HELMBOLD'S
FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Orgauic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

U

USE HEMBOLD'S

FLUID EXTRACT BUCHU.

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Palas and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

EARTHQUAKE PHENOMENA.

NUMBER II.

A distinguished writer has very beautifully as well as forcibly remarked, that "in order to bind together facts, *theory* is requisite as well as *observation*—the *cord* as well as the *fagots*." A very small portion of what is now received as exact science, has been brought to its present degree of perfection without the preliminary aid of theory. The attainment of definite conclusions is almost always greatly aided by the previous adoption of some plausible theory, as a "guiding hypothesis" or basis for observation. Hence, in the examination of earthquake phenomena, various theories have been adopted, which must stand or fall as facts are gradually brought to light, by careful and patient observation. It was only after the idea of the wave impulse was clearly grasped, that observations of these phenomena began to assume a practical and philosophical character; and as there are possibly many of our readers who do not even yet fully comprehend the fundamental conditions of the propagation of this motion, we will endeavor, at the expense, perhaps, of being thought tedious by some, to give a clearer idea of the same. Having no illustrations at hand, the reader who may be desirous of following us closely is requested to prepare himself with paper and pencil.

First draw a horizontal line, say three inches in length, which we will mark and call *a b*; now draw a perpendicular line of the same length, crossing *a b* at its center, so that one inch of this second line shall be above *a b* and two inches below; we will call this line *c d*; at a point on *c d*, say half an inch below *a b*, make a dot, which we will call *e*; now draw a series of circles around this dot, until your outermost circle shall touch the point where *c d* crosses *a b*. This point we will call *f*. Now draw another circle, which must, of course, pass through *a b* at two points near *f*. That done, proceed to draw four or five segments of circles below *a b*, and outside of the circles already drawn, with the ends of the segments resting upon the line *a b*.

The diagram being completed, let it represent a vertical section of a portion of the earth, and let *a b* represent a section of the earth's surface, and *e* the point of origin of the earthquake wave, which we desire to describe. In order to obtain a more accurate idea, the spaces between the circles should be so graduated that they should appear of less and less width, until the outermost one is reached—like the gradually decreasing size of the concentric waves produced by dropping a pebble into a smooth body of water.

Now, if we assume that the earth's mass is of a uniform density, the wave, starting from the point of origin, *e*, will travel outwards, in all directions, in concentric shells instead of circles, of course, with diminishing volume and force, until they become quite imperceptible. The shock reaches the surface first at *f*, directly over the origin, where, of course, it is vertical; in every direction diverging from that point, it reaches the surface at an angle more or less inclined, or approaching to parallelism with the earth's surface; thus giving a motion on the surface apparently like a sea wave, while, in reality, it is the arrival of the original impulse, or *wave of force*, upon the surface at successive intervals, and at successive points, divergent in every direction from the first *f*, and in direct lines from the center of disturbance.

If the reader comprehends the idea correctly, he will perceive that it is not a surface wave at all, but a mere succession of impulses reaching the surface at angles constantly diminishing, until the distance which it is necessary it should pass through is so great that the impulse is lost to the senses.

In order to explain this point more fully, let the reader refer again to his diagram, and from the point *e* draw a line reaching *a b*, a quarter of an inch to the right of *f*; now draw another line from the same point *e*, reaching *a b* half an inch from *f*. Draw a series of these lines touching *a b* at intervals, until the last one reaches it at the extremity or point *b*. Now, instead of a single wave impulse started at *f*, and projected along the surface of the earth like a sea wave, until it reaches *b*, suppose an indefinite number of impulses all started at the same instant from the innermost circle, around *e* and reaching the surface, as they would do, each one along its own line, at an indefinite number of points along the line *f b*, and you will be able to form an approximately correct idea of the character of an earthquake wave.

When the motion is vertical, the earth is suddenly raised and dropped again. As any given locality is removed more or less from a position directly vertical to the origin of impulse, the earth is pushed up and at the same time carried forward; a displacement and replacement of the integrant molecules of a given volume of matter taking place in a direction more or less vertical, according to the distance of the locality from a position vertical to the origin.

The size of such a wave—that is the volume of matter displaced, or of particles in motion at once, depends upon the elasticity of the substance operated upon, and the amount of the originating impulse. The movement is sometimes so very small as to impart nothing more than the slightest tremulous motion to the earth; at others the undulation of the ground is so great as to be perceptible to the eye, and the forward and backward throws may be approximately measured by its disturbing effects upon bodies resting upon the surface—as for instance a tub or box of water resting firmly upon the ground, from which the water is thrown, precisely as it is when such a vessel, so filled, is suddenly pushed forward by hand and as suddenly brought back to its original position—the water will be thrown out upon both sides, in a line conformable to the direction of the motion, if that motion be great enough. Again, the tops of trees are made to thrash backward and forward, by their roots being suddenly carried forward and as suddenly brought back by the wave of impulse. A remarkable instance of the effect of an earthquake passing a city in a direction diagonal to that of its streets is recorded, where an observer, standing at the end of a street had his eye, at the moment, upon the face of a long row of very high brick buildings. As the impulse struck the farther end of the street, a distinct and continuous wave of the entire front was noticed, running rapidly along its length, as though a huge hanging blanket had been suddenly shaken at one end, with sufficient force to transmit a wave of the fabric to its opposite extremity. The backward and forward motion may be supposed to be greatest at a point perhaps not far from half way from the point vertical and that where the motion ceases to be plainly perceptible; while the elevation and depression is greatest at the point directly vertical to the original impulse.

The velocity of the translation of the earth-wave depends, to some extent, upon the character of the formation through which it passes. If the mass is firm and homogeneous it moves rapidly; if broken into thin strata it is greatly retarded. From thirty to fifty miles per minute has been observed, under favorable circumstances, as the rate of motion. Perhaps the best opportunity to observe its altitude is upon the sea. When the earth-wave moves under the sea, it lifts the water up and carries it along, as it were, upon its back; for the rate of transit is so great that the elongated, wave-like heap of water lifted up does not have time to subside laterally. The elevation of this wave will be much less than that of the land beneath; but the opportunities for observation will be much more favorable. When the wave approaches the sea-shore from inland, it carries the water away from the beach, producing an outward wave—this will be especially noticeable along a shallow shore; on the contrary when it comes from seaward, the water is carried forward and over the beach. Of course a wave coming from the sea must not be confounded with the reflux of one passing outward from the land. These waves are the cause of the slight disturbance which is always noticed at the margin of a still sea or bay, at the instant of an earthquake.

In the earthquake of the 8th instant, the waters of Mission Bay, in this city, which are very shoal, and which were quite calm at the time, were very much agitated, and covered with bubbles. These bubbles were caused by the disengagement of gases from the mud, as the same was disturbed by the passage of the earth-wave, and the agitation by the lifting of the water into a wave, as already described. The shocks so frequently noticed as being received by vessels at sea, during an earthquake, are conveyed to the vessel's bottom precisely as the percussion spoken of in our first article, is caused to pass through the tube of water there described, and made to act with percussive force at the opposite end.

The most severe earthquake shocks of which we have any account, have had their origin under the sea, throwing land-ward large waves, which at times have overflowed wide tracts of land, carrying off and destroying thousands of human beings. In 1693, a wave of this description flowed in, to the hight of twenty feet or more, upon the coast of western Europe, from Sweden to the Gulf of Gibralter, and thence down the coast of Africa to an unknown distance. This wave destroyed many thousands of lives. A similar wave, and causing equal destruction, occurred over the same territory, in 1755. During the latter, the return wave, at Lisbon, is reported to have been sixty feet high, and as it swept in upon the city destroyed 60,000 people! It should be borne in mind that the hight of these waves is often very much affected by the character of the coast. In deep ocean water, the wave may be scarcely perceptible in hight, yet of immense volume—being very broad—so that when it approaches a shallow shore, with the velocity it attains, its volume increases its altitude, until the depth of water becoming less than the altitude of the wave, it topples over and comes ashore as a huge breaker, the formidable and destructive nature of which is well known. The velocity of such waves being much greater than that of ordinary sea waves, it breaks with much greater force, and a proportionally increased capacity for destruction.

We have heard it stated, that at the time of the earthquake on the 8th instant, a wave of this description was noticed at Oakland, two feet in hight; but as that locality is extremely unfavorable for the development of such a wave, we are inclined to question the accuracy of the report; although if such an observation had been made at any favorable point for such a development, we should suppose such a result to have been highly probable.

We had intended, in this number, to have explained the philosophy of the apparent twisting motion sometimes imparted by earthquakes to bodies resting upon the earth, or other less substantial bases; but the space already occupied precludes further discussion of this matter at this time.

NOTE.—In our remarks under this head, last week, several important typographical errors escaped our notice in the proof. Near the bottom of the first column, for "if that water be heated to something more than the boiling point," read "if that water be heated to something near the boiling point." Again: Near the top of the last column on the page, for "earthquakes producing gas explosions," read "earthquake-producing gas explosions."

RETURN OF SECRETARY MCCORMICK.—Hon. R. C. McCormick, Secretary of Arizona, returned by the Colorado, from New York, bringing with him a bride. He left *en route* for Arizona, on the Senator, which sailed on Thursday. In addition to the new and happy social relation in which he again comes among us, he has the gratification of returning with the high satisfaction of having had his accounts all promptly adjusted, and his conduct of the territorial finances highly commended by the Treasury Department at Washington. The friends of the honorable Secretary gave him a sumptuous entertainment at the Astor House, just prior to his leaving New York. The affair was graced by the presence of many distinguished men, and was eminently successful in every respect.

A "GUN-COTTON ENGINE," invented by M. Jules Groe, is favorably reported upon by *Les Mondes*.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction—A General Review—No. XVI.

BY PROF. L. LANSZWEERT.

In continuing my remarks upon silver processes, the last of which appeared in your issue of July 29th, I would say that in the Freiburg process, it is of the utmost importance that no free proto-chloride of copper should be present in the reduction of silver ores, as by giving up to the mercury one-half of its chlorine a considerable loss of that metal is produced by chemical reaction. When this does occur, lime is added for the purpose of decomposing the excess of chloride of copper, and its prejudicial action on the mercury is arrested.

USE OF DICHLORIDE OF COPPER IN THE PAN PROCESS.

To avoid this loss, which at the end of the year forms a considerable item in the expenses of a mill, and to facilitate a more direct and easy decomposition of the sulphurets of silver in the Washoe ores (admitting the *rationale* of the theory of the patio process as explained in my last number), I availed myself during my stay in Washoe, of the opportunity to try the direct use of dichloride of copper (cu^2cl.) on the different ores there presented. The success realized quite surpassed my expectations. The results were obtained by comparative experiments made on a large scale, by reducing from five to five hundred tons of the various Washoe ores, such as Gould & Curry, No. 2, Chollar, Potosi, Olney, Rogers, Gold Hill, etc.; and were attested by certificates from Guido Kustel, Col. Brevoort, Mr. Lambert, J. Corey, Joseph Trench and others, as the experiments were conducted at their several mills. They averaged, according to the nature of the ores, from within five to twenty per cent of the assay value of the ores.

The quantity of dichloride of copper used was based on the analysis of the ores, and the percentage of the sulphide of silver they contained. Taking, for example, an ore assaying $100 per ton, we would have, according to analysis, sixty-two ounces of sulphide of silver, equal to fifty-four ounces of metalic silver, at $1.29 per ounce which is worth $70, and free silver at $30 = $100.

The patio process requires for the reduction of the above amount of sulphide of silver 125 ounces of sulphate of copper, 590 ounces of salt and 100 ounces of mercury; the mercury being lost by decomposition as a chloride of mercury—the calomel of the apothecary.

Now, if we use, instead of the above, the *dichloride* of copper, 47 ounces (the quantity required for the reduction for the amount of sulphide of silver present), + 400 ounces of salt, and 100 ounces of mercury, there will be no loss of the mercury.

In nearly all enterprises of this kind a great many obstacles are thrown in the way of success, by reason of the stubbornness, incapacity or avidity of those having charge of the different works. So in this case; notwithstanding the proof was abundant of more favorable results than were being obtained by the old processes, still such was the systematic opposition presented by superintendents, amalgamators and others interested in retaining present positions or in continuing the use of other processes, the writer found it impossible to introduce his process into permanent use in any of the numerous mills in Washoe. Time and circumstances will eventually accomplish for the mining interest of that locality, what the stubbornness or incapacity of the early operators there refused to allow; although thousands of dollars might thereby have been saved to individual companies alone.

Although the preparation of dichloride of copper is very easy and simple, still a great many attempts to prepare it have failed; the operators preparing, instead, a mixture containing a large percentage of proto-chloride and very little dichloride of copper: and being in consequence disappointed in the results from the use of this preparation, they have condemned a process which my own careful experiments on a working scale have proven to be the best yet adopted for the reduction without roasting, of a certain class of Washoe ores.

BENEFICIO DE LA PELLA DE PLATA—EXTRACTION BY SILVER AMALGAM.

This process was introduced in 1676 by Juan de Carrosegarra. In its use amalgam of silver was added to the mercury, aiding the action of the same in the extraction of the silver from its ores, by which the loss of mercury was considered less, as the amalgam disseminates with more facility through the mass, than the pure quicksilver. Every miner is aware of the fact that pure quicksilver will never amalgamate so readily in its first use for amalgamating purposes, as in its subsequent employment—it must first become "charged."

BENEFICIO DE LA COLPA

was first employed by Don Lorenzo de la Torre, and used in place of an artificial *magistral*, which contains more sulphate of copper than sulphate of iron. A natural mixture, called *colpa*, consisting of an acid sulphate of iron and peroxide of iron was added to the *torta*. This process offers the same advantages as the *beneficio de hierro*.

BENEFICIO DE CASO Y COCIMIENTO—AMALGAMATION BY BOILING IN COPPER VESSELS.

This process was introduced in 1590, by the presbyter, Alonso Barba, who was then living in the royal city of Potosi. Second in all the metallurgic lore of his time, and gifted with an acumen which few of his slothful successors have inherited, he bequeathed to the world a system of metallurgy (the second ever written), and edited by Molinos, at Madrid, in 1728, which, divested of its obsolete nomenclature and the erroneous views of the chemical constitution of bodies prevalent at that early period, is still a text-book for writers on the science. In this work he has shadowed forth the first crude idea of the doctrine whose adoption by its professors has revolutionized modern chemistry. "His views of the rationale of the different processes," says Sonnenschmidt (no mean authority,) "are so clear and practical, his ideas so far in advance of the age, his suggestions so judicious and so modestly enforced, his improvements so many and so important, as to leave little doubt that, working by the light of modern sciences, he would have left us the process of *patio* amalgamation absolutely perfected and have left nothing to the ingenuity of subsequent inventors."

If the owner of one of a lately most boasted process (boiling in copper pans.) had consulted scientific works, he would have learned the reasons why it was never generally adopted and for which very soon be also will abandon it too. This same process was revived in 1786 by M. DeBorn, and lately Juan de Ordonez recommended amalgamation in kettles heated by stoves, to which idea Washoe is indebted for its first "Stove or Iron Pan" out of which the whole family of iron amalgamating pans has grown. Verily, "there is nothing new under the sun."

[Written for the Mining and Scientific Press.]

The Mines of Nevada County.

Messrs. Editors:—To acquire a thorough knowledge of the mineral resources of Nevada county, renders necessary something besides simply a residence here, or a "flying tour of observation." A county containing more square miles than some of the Eastern States of the Union, which can boast of as rugged mountains, deep cañons, and as sublime natural scenery as far-famed Switzerland, cannot be traveled over and mapped out by the eye or the imagination in a day. The unseen wealth of her hills (I follow custom in regard to gender) can only be estimated by the fancy of the individual beholder, whose data or basis of calculation is as misty and uncertain as the fogs of Egypt. But in this fast, and comparatively early age of mining in this country, we must be content to examine only the outer rim of the earth's surface for mineral wealth, and leave to coming generations the herculean task of penetrating to those Plutonian depths, where natural heat, does the smelting, amalgamating, and retorting on a scale of magnitude that would cause the most "improved pans" or "revolving stamps" to subside into insignificance. The most deeply learned geologist or mineralogist may visit our hills, spend weeks in examining different mines that have been partially developed, note the stratas and formations of rock—the innumerable surface-indications that Nature has scattered about so lavishly—and yet he can tell us no more about the prospective mineral wealth locked up here, betwixt slate and granite walls, than we already know.

Every observing, intelligent man here is aware that this county is rich in metallic wealth—rich enough for the general welfare of all who are here now, and all who may come in the future. There is a more healthy and established feeling of confidence among miners and moneyed men at this time concerning the wealth and inexhaustibility of our quartz mines than has ever been known before. Croakers, who would have had the mines "played out" long ago, have either left the country for the "country's good," or gone to work, disgusted or ashamed with the falsity of their prophecies. Capital is greatly needed for the further development of old, and the opening of new, mines in the immediate vicinity of this city; but if capitalists, outside of our immediate vicinity, are not disposed to invest in our mines, it will not stop entirely the wheels of progress. Local energy and capital, within the past few months, have produced results far better than was expected.

The Star Spangled Banner ledge, owned by Messrs. Kidd and Tisdale, located on Little Deer Creek, two miles from this city, is yielding steadily about 450 tons of rock per month, which averages $40 per ton, and the cost of mining and hauling the same is less than $10 per ton, leaving a net profit to the owners of over $30 per ton. These same gentlemen are also raising 200 tons of rock per month from the Mohawk ledge, on Gold Flat, which yields $50 per ton. The net profit on this rock cannot fall short of $35 per ton. The owners of the Willow Valley ledge are running a tunnel which, when completed, will strike the ledge at a depth of 70 feet. This claim was discovered last spring, and an incline sunk on it some 50 feet, when the water prevented further progress. From this incline 100 tons of rock was taken, yielding $33 per ton. As soon as the water in the incline is drained by the tunnel, the owners will be able to take out a large amount of rock, as the ledge is from two to four feet in width. Messrs. Dowd & Carr have recently discovered a ledge but a short distance from the Willow Valley location, which yields about $20 per ton. The Nevada Quartz Mining company, two miles below the city, on Deer Creek, have been taking out a large amount of rock lately, and their 12-stamp mill is kept busy at work. The Providence company, on the same ledge, on the opposite side of the creek, under the superintendence of Mr. Dingley, are extending their upper tunnel into the hill. They have a ledge in the further end of this tunnel over 12 feet wide. The character of the rock, however, is not good; yet, if the company will but persevere, there is scarcely a doubt but that they will soon find a better class of ore that will amply repay them for all their previous mishaps and discouragements. I make this remark, because the owners on the same vein, across the creek, ran their tunnel on the ledge for a distance of 300 feet before they found good pay rock. This shows the benefit of perseverance, and if the stockholders in the Providence company will but imitate the example of their neighbor on the same ledge, the chances are that they will meet with as good if not better success. Mr. Diogley is driving the tunnel ahead with energy, and I trust will soon meet with a better quality of rock. In running in a cross-cut from the main ledge, a vein of good pay rock has just been found.

The Star Quartz Mining company, in Eureka township, above Cañon Creek, have recently struck, in their tunnel, a splendid ledge, some five feet in width, containing fine gold, and sulphurets of iron in abundance. Their mill is now in good running order, and they expect to commence crushing in about ten days.

At Bowman's ranch, on the Henness Pass road, several ledges have recently been located that have the appearance of being very rich in gold. Rock from the Galena, one of these locations, yields as high as five dollars per pound. The ledge varies from six to eighteen inches in width, and contains a large amount of galena. A ledge known as the "American," near the Galena, promises to be of great value, but its owners, for lack of means to develop it, are obliged to let it remain for the present unprospected. The Jefferson company recently had a crushing of ten tons of their rock at their mill, which gave a return of $30 per ton. They have out some 300 tons of rock equally as good as that already crushed, but the mill is now idle for want of water. On account of the cold and deep snows that fall at Bowman's, it is doubtful if the mill will be able to resume operations before next May.

From the Excelsior district we have but little that is new or interesting. The near approach of cold weather at that high altitude, and the prospect of eight or ten feet of snow, has admonished many to leave that region, and wait until the return of spring. Two mills, I am informed, will be in running order this fall, but I doubt if they will be able to keep them in operation this winter, on account of the severity of the climate. Parties from this district, with whom I have conversed, all speak favorably of the mines. The ledges are numerous and generally large. Some of them contain no mineral indications whatever, and others are represented as being very rich in gold, with a small percentage of silver. Those having located claims there seem to have no fear of their being "jumped" before late next spring—ten to fifteen feet of snow being considered an ample protection while it lasts. At Summit City six hotels have been erected, several of which are of good size and substantially built. Nine-tenths of all those owning claims in the district are represented as men without capital, who are unable to develop their ledge, but, Micawber-like, are "waiting for something to turn up." Next spring, the rush to Excelsior district bids fair to equal the Reese River excitement of two years ago.

At Washington two mills for crushing cement are now in operation. In Little York township the cement diggings are very extensive, and a large amount of capital has been expended there in the erection of mills and machinery. Eight mills, running on an average eight stamps each, are in operation, and five more are to be built this fall and winter. All this property, remember, is being brought about by *local* capital and enterprise, which shows that, as a county or people, we are not wholly at the mercy of Eastern nabobs, or San Francisco Shylocks.

There is some prospect of a railroad being built to this city from Colfax within the next two years. The subject is being extensively agitated here, and funds to make the necessary surveys and estimates have been subscribed. An effort will be made this winter to obtain a charter, and to have an act passed authorizing the county, if the voters so determine, to issue a certain amount of bonds in aid of the contemplated road.

Nevada.

[Written for the Mining and Scientific Press.]

Austin Going Ahead.

On my return to this place, I find much increased activity in every thing appertaining to the development of the mines, the perfecting of reduction works, and the introduction and distribution of capital. Many of the mills commenced when I left are now on the eve of completion; and many others at that time on their way from New York and San Francisco are now taking their respective positions in the several districts for which they were destined. Another very interesting feature in the progress of the enterprise peculiar to this place, is the rapidity with which valuable mines change ownership; for no sooner is a good ledge located, and so far developed as to give positive evidence of its worth, than it is sure to be purchased in the interest of Eastern capitalists, whose agents are here for the ostensible purpose of investing in all such property.

MONEY ABUNDANT.

The nearest approach to the lavish liberality of the early days of California mining that I have yet seen, is to be found here at the present time. The old pioneers and prospectors are now reaping their just and well-earned reward. This class of men are certainly the founders of this country's greatness; for to their energy and almost reckless daring must be attributed the fact of the vast discoveries daily being made, which are bringing it before the world as the first in mineral wealth of any yet discovered, and thereby attracting capital to an almost unlimited extent. Besides the vast increase in the circulation of money occasioned by the heavy purchases of mines, which, by the way, is mainly paid in currency, Uncle Sam's indorsement being considered A 1 in this section of country, increased accommodation and facility is being afforded for obtaining the use of money by the establishment of a Bank.

"FIRST NATIONAL BANK OF NEVADA,"

Is the title of this institution. J. W. Harker President; N. C. Fassett, Cashier. Capital, $200,000; chiefly owned by Eastern men. This bank proposes to loan money at a very moderate and a uniform rate of interest, which will be alike to all offering acceptable security and far below ruinous rates heretofore exacted in this place. The bank will purchase bullion,

and having a refinery and assay office attached, will stamp their own bullion and guarantee its correctness.

Mr. Harker has purchased the best building in the place for the bank office, which is situated in the most central portion of the town. The office fixtures and bank-vault are now being placed in position, and their assay office just finished, and ere this comes before your readers the institution will be fully under way. The outlay for bank office, building vaults, safe, etc., is $20,000.

The eastern owners of the bank capital have also invested largely in the mines of this district. They are represented here by Major C. B. Raymond, a gentleman of much experience in mines and mining operations generally, besides being a most thorough business man, these qualifications amply fitting him for the very onerous duties which will devolve upon him. This mining corporation is known by the name of the "United Reese River Mining Company" of Boston. The company own in some twenty-four different ledges, in many of which they hold controlling interests, while others they own altogether. Among their numerous mines are those of the Whitlatch Union, Camargo, Diana, Buel North Star, Black Ledge, Honest Miner, Nevada, Yankee Blade, and others too numerous to mention here. Since commencing operations on the Whitlatch Union, rich pay ore has been struck, and the true vein discovered, which for some time back had been at fault. Good pay ore is also being taken out from the Honest Miner, and the Diana is yielding a splendid supply of very superior ore, which the company are now working in the Eureka mill, at Big Creek, they having leased that mill from D. A. Buel. They intend to prospect all their claims by this mill, when, if results obtained justify, they will build a more extensive one. This I consider a very wise and judicious course, and shows at once the caution, sagacity, and prudence of Major Raymond, in first properly developing his mines and proving their merits before erecting reduction works at immense expense, which afterwards may be found uncalled for. This mistake, I fear, is being made here by a few, who are investing most liberally in mill buildings, without spending a cent so far towards the development of their mines.

The U. R. R. Mining company was organized in Boston at the instance of Mr. J. W. Harker, who having gone East with the mining property already mentioned, soon found capitalists to invest as well in the mines as to open a bank of accommodation, as already described. To Mr. Harker is certainly due the credit of having the attention of men of means drawn to the due development of these valuable mines, as also of having banking accommodations on liberal terms established in this place.

OUTSIDE DISTRICTS.

Several outside districts are attracting considerable attention here at the present time. Foremost amongst them are those of Twin River, Silver Peak, Volcano, and San Antoine. The Twin River district is distant from Austin 55 miles, in Nye county, where is situated the far-famed "Murphy" ledge. This ledge is considered one of the richest in the State, being at different points at a varying thickness of from 25 to 30 feet, and 1,000 feet in location. The ore from different depths assay from average samples from $250 to $730 per ton—the first working by mill process yielding $480 per ton. A lot of 70 tons, worked at the Butte mill, near Austin, returned $184 per ton. This mine was located by Mr. G. H. Willard, in July, 1863, when he associated with himself four others. The company not having sufficient ready cash to put up reduction works, sold four-fifths of their interest for the sum of $50,000, gold coin, retaining one-fifth of the entire capital stock of the company unassessable, and binding the purchasers to set aside $300,000 of a paid-up working capital, to erect hoisting, pumping, and milling machinery, build roads, etc., etc. The purchaser of the mine is Mr. R. B. Canfield, who bought in the interest of his father, A. W. Canfield, of New York.

This company have excellent privileges of wood and water, and any amount of salt in their immediate vicinity. Their mill site is so situated that their ore cars can be run from their mine into the mill. They are engaged in building a road from the mine to connect with the "Smoky Valley" road to Austin. Mr. R. B. Canfield is now in San Francisco, forwarding mine and mill machinery to their mine. The mill is to have 20 stamps of 900 pounds each. It is computed that with a mill of such capacity they can reduce 15 tons per day, setting the ore at $163 per ton, and allowing $33 per ton to cover all costs, leaving a net profit to the company of nearly $2,000 per day. The mining superintendent of the company is Capt. G. W. Shears, an old "Lake Superior" copper miner, and a man of very fine general knowledge of under-ground mining.

Another of the noted ledges of this district is the "McDonald," owned by S. H. Willard (of the Murphy mine), L. H. Newton, and Harry Mills, this being the first extension south of the "Murphy." This company are going down on their ledge by a shaft distant from the incline of the "Murphy" only 40 feet, and showing equally as fine ore. The mine is under the superintendence of Mr. G. H. Willard, the fortunate and enterprising discoverer of the Murphy ledge, and by whom the Twin River district was formed. This gentleman is one of those worthy and energetic pioneers, who is now reaping a rich reward for the years of arduous toil spent in hope and expectancy, while patiently but persevering searching for nature's hidden treasure.

There are several other very fine ledges in the Twin River district, such as the Central American, Savage, Golconda, Arizona, Great Eastern, Mozart, Chamblin, and Harmon, all of which are being thoroughly developed.

THE SILVER LAKE DISTRICT

Is now foremost amongst the mines of attraction of this State. And as my notes of this important mining district are too lengthy for my present article, I will defer a notice of it to your next issue of the PRESS. Some very heavy sales of mining property having taken place, and others to my certain knowledge now being negotiated, I deem it of sufficient importance to devote my next communication entirely to that district.

VOLCANO DISTRICT

Is now notorious from the fact of some mines of cinnibar being discovered there. The first notice, or rather discovery of this mineral, was made by a man named M. Ensign, and was at the time thought but little of; but subsequently Mr. Ensign and Mr. John Frost, of the Oregon company, at Austin, having paid some attention to having it more thoroughly tested, and having proved it to be valuable, had the mine properly located, a district formed, and secured to themselves and a few friends what certainly must be, in such a country as this, a mint of wealth to the fortunate discoverers. Mr. Ensign, with a force of men, has been sinking a shaft upon the mine. He arrived here, a few days since, with a sack of the ore from a depth of 120 feet, which he left with the writer for assay. Several tests have been made, every one of which has shown quicksilver. He has now returned to the mine to attend to its further development. Your readers may expect to hear more of this valuable discovery as soon as its value per ton and its extent and character is fully ascertained.

J. R. M.

Electrical Queries.

MESSRS. EDITORS:—I always read the MINING AND SCIENTIFIC PRESS when it comes within my reach, and last evening I perused an article on "The Relation of Electricity to Matter," and through you, and with your permission, I would ask your correspondent a question for information.

In the first place I understood him to say that electricity is not an entity, but a condition. If that is the case, how is it that it passes so readily through what we call a vacuum? In the second place, I understand him to mean that the capacity of a body for electricity is, like heat, in proportion to its intensity. I once read in a scientific work that water probably excelled every other known body in its capacity for heat, and yet it is not the densest known body. Have I misunderstood either or both?

My head was never very clear about ocean telegraphy; but the idea of a current losing, or being lost, on its way back, upsets my whole train of thinking. I once read a description of an experiment that went a great way, in my estimation, to show that a current was longest in reaching the middle of a conducting wire, and that at two points, equidistant from each pole of a battery, the current was simultaneous. Said experiment, and several other matters, induce me, when I say current, to mean the coercion of the electricity in the circuit to a polar condition. This being my idea of a current, I would feel obliged if your correspondent would show me where I was wrong, or explain the seeming discord.

I would also ask upon what train of reasoning he infers that the inductive effects of terrestrial currents would be less on an insulated wire than they would be on the whole world as a conductor.

ARTHUR COOPER.

Grass Valley, Oct. 18, 1865.

GOLD IN THE COLUMBIA RIVER.—It is said that several very fine gold prospects have been found on some of the bars in the Columbia river. One man is reported to have recently taken out $500 in a short time from a bar on that river.

Useful Information.

THE COLOSSUS OF RHODES.—Next to the Egyptian Pyramids, the Colossus of Rhodes has been considered the chief among the seven ancient wonders of the world. It is reported to have stood astride of the narrow entrance to the harbor of the city of Rhodes; its hight being 105 feet, so that any vessel of those days could pass between its great legs. It was the workmanship of Chares, who was employed twenty-one years in its construction. History tells us it was thrown down fifty years after it was finished, by a terrible earthquake—which occurred B. C. 300. Of late years many learned men have come to the conclusion that very crude ideas, and much fabulous exaggeration has existed with regard to it. Dr. C. F. Luders, Professor at the Johanneum at Hamburg, has just published a critical historical treatise on this structure. According to his researches it is reduced to nothing more than a colossal statue, standing on *terra firma* like the Bavaria at Munich, but near the harbor, and not across its mouth. He insists upon it that its standing open legged across the mouth of the harbor, and being used as a lighthouse, is a pure invention, and an emanation of fancy from later writers.

PIT HOLE.—This now famous oil locality at the East, derives its name from an immense pit or crater on the top of a mountain near by the base of which the wells have been sunk, which have recently produced such extraordinary returns. This pit has the reputation of being of great depth, but has never been explored, owing to the noxious vapor and gases constantly arising from it. It is about twenty feet diameter at the mouth, and a fowl suspended in it will not live a minute, and in fifteen minutes will become putrid. The first well sunk in this neighborhood is a short distance from the base of the hill, and was bored to the depth of 700 feet.

ERADICATION OF STUMPS.—Where it is necessary to remove large stumps under circumstances which render it impracticable to avoid one's self of the assistance of a "stump machine," the work may be successfully accomplished by burning. This is done by digging under them, filling the cavity with combustible materials, and covering the stump, after firing the materials, with turf, in the same manner that coal-kilns are covered. The fire will in a short time effect the entire destruction of the stumps—even the long lateral roots, unless the soil is very humid, in which case the burning should be undertaken during the dry weather of summer. If the dirt is excavated a few weeks before the burning is undertaken the operation will be more speedily effected. The ashes produced by the combustion will afford an excellent stimulus for the soil, and should be carefully supplied as soon as the operation is completed. But in all cases where eradication by pulling is practicable, the stump machine should be used.—*Germantown Telegraph.*

BALING GREEN HAY.—Experiments have been made in packing green hay with entire success. The dew or rain is dried off, leaving the stalk still green, but wilted. The hay is then pressed in bales and stored away. It will come out in winter almost as fresh as it went in, losing comparatively but little in weight. Of course, this is an improvement upon the old method, as the juices of the grass are retained.

We give the above on the authority of the Massachusetts *Ploughman*, pretty good authority generally; but it strikes us, in this instance, as a little doubtful.

A FRENCH photographer has made arrangements for descending to the bed of the ocean in a submarine vessel, provided with electric light, and making submarine photographs.

"MOON ON THE LAKE," is the curious name given to the latest favorite color for ladies' dresses at the East. A new style of veil is also coming into use in New York. It is long and narrow, drawn and fastened to one side of the bonnet, the side of the veil being thrown gracefully over the front; it has a very fine effect.

GEN. GRANT, it is reported, will soon visit Europe, where he will remain. Gen. McClellan, at last accounts, was expected to arrive at New York, soon from his European tour.

Tubing Oil Wells.

Many oil wells, both in the Atlantic States and in California, are injured if not ruined by bad management in tubing. The tubing is sometimes made of too thin iron, in consequence of which a very slight inequality or roughness of the walls of the well break and render it useless. At the East it appears that one of the most fatal errors consists in placing the seed bag too low, with the view of cutting off and excluding the surface water. We are not aware that the seed bag has yet been employed in this State, for the reason that our well borers are not seriously troubled with water; still it may be well to keep constantly before us the experience of oil men on the other side of the continent, that we may profit thereby. With this view we clip the following from the Oil City *Register:*

When the process of pumping a well, thus tubed with the seed bag placed too low, commences, the water is soon exhausted; then comes a rush of oil to the bottom of the working barrel. This creates an unusual quantity of gas, which has a tendency to hold up the valves, increases the speed of the engine, wears out the pump, and endangers the sucker rods. It is our impression that this would be avoided by placing the seed bag at from 100 to 130 feet from the surface of the well; if placed in such a manner, it would exclude a great majority of the fresh water, leaving some small veins to mix with the oil, which would constantly feed the pumps, and have a tendency to create a constant flow of oil and water. In such a case the engines would work more steadily, and with far greater ease, and there would be far less strain on the walking beam and sucker rods.

The length of tubing in a well should be governed by the locality of the largest oil veins, for it is necessary to form the greatest strength of vacuum at such a point in a well, so as to suck the oil and paraffine out of the seams or crevices in the sand rock.

It is, undoubtedly, a common error of tubing too low, where there is a poor engine and a small power. These hints are thrown out as the result of practical experience and facts, in the hope that some one may be benefited by them.

AUSTRALIAN GEMS.—An exhibition of colonial gems recently came off in Melbourne, Australia, consisting of diamonds from the Owens River, near Beechworth, rubies, opals, garnets, saphires, amethysts, &c., cut and in the rough, from various parts of the colony, were on view, and excited much interest among miners and others. It is thought by the colonial papers that many thousands of precious stones have been thrown away among the "tailings" of wash-dirt and crushed stuff by reason of mining eyes not yet having become habituated to recognizing one stone from another in its natural state.

TULARE VALLEY is rapidly filling up with settlers. The discovery and development of the rich mines in the eastern portion of the county, and a knowledge of the fact that the oil regions of the western portion must soon begin to attract capitalists thither also, is giving a prospective value to the rich farming lands in the interior, which settlers are beginning to avail themselves of to a large extent. It is said that *thirty* families settled in the valley during the month of September.

A MONSTER LEMON.—It is thought that California, true to her invariable principle of being ahead in everything, has now produced what is probable the largest lemon ever grown. The last steamer brought up from Los Angeles a lemon which measures 18½ inches in circumference one way, and 13 inches the other, and is sound and perfect. California still against the world!

MORE HOT WATER.—The Virginia *Enterprise* says that a stream of hot water was struck a few days since in the new Chollar Potosi shaft, at the depth of about 400 feet. The stream was about the size of a man's finger, and was almost scalding hot. After running some five hours it ceased to flow, and has been dried up ever since. It is supposed that the water came from some pocket or crevice in the rock which was lined with iron pyrites in a state of decomposition.

SALES OF THE WEEK
BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, October 21.

120 shs Chollar at 410@430 per foot.
52 shs Chollar at 415@430 per foot, s 3.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 28th, 1865.

The condition of the money market has undergone no material change since our last reference. There is, if anything, a slight increase in the demand for certain purposes, but the general inactivity of trade occasions a light business requirement. The excitement upon the Stock Exchange has somewhat moderated, but mining stock collaterals appear to be in no better favor with certain capitalists than they have been for a month past. Rates of interest are ruling at 1@1¼ ₱ cent. per month in bank, and at 1½@2 ₱ cent. for outside negotiations.

Receipts of Treasure from the interior, since Saturday last, amounted to $950,000, making an aggregate of $4,050,000 thus far during the current month.

Bullion has been in fair request this week for Monday's steamer, and gold bars have been taken to account by bankers, and others, at 845@860. Silver met with some inquiry at par@¼ ₱ cent premium.

The Stock Market has been characterized by considerable activity this week, and with scarce an exception nearly all shares have shown some improvement. The short interest continues to attract the attention of some dealers, and seller's option contracts are still made with freedom. The prospective demand for stock for future delivery growing out of these sales, imparts a little strength to the market, but recent intelligence as to the actual condition of a number of claims is not deemed favorable, and in the absence of a speculative demand for a rise, it will be difficult to enhance prices very materially at present. It is, however, proper to state that there are those who feel no apprehension as to the future productiveness of certain prominent mines, and who think it is not reasonable to conclude that they will suddenly become valueless, or even approach the condition predicted by a certain class of croakers.

Alpha is inactive, but well controlled, and 13 feet were sold, declining from $1,100 to $1,010, rallying to $1,055, and closing at about $1,075 bid Arrangements are at once to be made for the thorough development of the lower level of this mine through the shaft of the Imperial Company, from which portion no ores have as yet been hoisted.

Gould & Curry rose from $1,000 to $1,080, declined to $1,025, and closed at $1,000. There is no material change in any portion of this claim.

Yellow Jacket has been very actively dealt in, and nearly 200 feet changed hands, advancing from $725 to $1,000, declining to $780, rallying to $850, buyer 30, then selling at $810@$740, and closing at $765. During the week ending October 16th, 41 tons first-class and the 1,305 tons second-class ores were extracted from the mine. During same period 930 tons second-class ores were reduced, yielding $33.303.42, or an average of $35.78 per ton. In running north from the 360 feet and 280 feet levels, considerable bodies of good ore have been reached; and in drifting north from the air shaft, sunk 25 feet below the 360 feet level, after passing through a broken mass of ore, porphyry, and clay, good ore has been found again, and promises to hold out well. The south drift, east stratum, lower level, shows a face of quartz.

Savage is in rather less favor, and some 40 feet were sold, advancing from $900 to $1,000, receding $895, then selling at $825, buyer 30, and closing yesterday at $800.

The Minnesota Mill, recently bought at a cost of $40,000, is now running for the company, and crushing some 30 tons of ore per day. Their present debt, exclusive of the monthly payments of $5,000 each, extending over a period of eight months, to be made on account of this purchase, now amounts to about $175,000. An assessment of $100 per share was levied on the 24th instant. A number of extraordinary expenses have been incurred during the present quarter, amounting in the aggregate to $100,000, for the new shaft and other improvements, which have aided in swelling the liabilities of the company. The mine is now yielding about 120 tons of ore per day, worth at the mills some $40 per ton. The east drift, on the vein in the lower level, still continues in good ore.

Crown Point has been in less request, and small sales were made, advancing to $900, dropping to $840, rallying to $850, and closing at $760 bid. In addition to the Rhode Island and Crown Point mills, the Atlas Mill has been employed, and is now crushing for the company The character of the ore taken from the 230 feet level has of late somewhat deteriorated. The inclines from that level are being sunk as rapidly as possible, all three of which now carry ore, and are said to look exceedingly well. Good indications have been met with lately in the lower level drift, and the lode is thought to be near at hand.

Belcher was in much better favor early in the week, advancing from $400 to $540, receding since then to $450, and closing at $460. Some seams of good ore are now being worked in the 300 feet level, which may lead to something better.

Ophir has been active, and nearly 180 feet has been sold, advancing from $375 to $430, steadily declining to $385, and selling yesterday at $385.

Hale & Norcross rose from $325 to $367½, dropped to $340, and sold at the close at $325. Cross-cutting has commenced from the north drift on the 700 feet level, and some promising looking quartz and much water has been met with thus far In "raising up" from that level a connection will soon be made with the south winze, sunk from the 535 feet level.

Chollar has been active, and more than 200 feet were sold, advancing from $370 to $430, receding to $390, and selling yesterday at $390@$392. Potosi rose from $350 to $410, receded to $365, closes at about $362, within which range 110 feet changed hands. Drifting continues north of the Potosi shaft, above the level of the Potosi tunnel, disclosing about 50 feet of good ore thus far. From the stopes in the Bajazette ground, about the usual quantity of ore is now taken. It is proposed to open a new level, eighty feet in length, at this point, in order to work up from beneath. The new development in the north end of the stopes, in the fifth station, is turning out some 20 tons of ore per day. This body has been traced 20 feet above the 4th station of the Chollar mine, and bids fair to prove of some value. From the old air shaft, they have run two drifts, southwest and southenst, and present explorations disclose a body of low grade ores, 30 feet wide, 30 feet long and 70 feet high, equal to 5,000 tons. During the week ending October 21st, 470 tons of ore were shipped to custom mills, and 583 tons were sold at $7@8 per ton. The new shaft is timbered to a depth of 452 feet. The consolidated Chollar-Potosi stock is now being issued to the shareholders of the old incorporations.

Imperial rose from $175 to $205, receded to $182½, rallied to $190 buyer 30, then sold at 193, and closed yesterday at $196@$194, at which rates more than 1,000 shares have been sold. It is said upon reliable authority that this mine is looking fully as well as ever, and that the yield this month will show a considerable increase over the two past months. A large reserve of ore is being accumulated to provide for the contingencies of winter. Receipts of bullion during the month of October, including balance carried over, will probably amount to $110,000, leaving at least $50,000 for the next dividend, after meeting current and extraordinary expenses.

Empire Mill and Mining Company rose from $150 to $170, and closed at $170. Overman advanced from $95 to $122½, fell to $102½, then sold at $97, and closed yesterday at $99. Bullion fell to $62, rose to $82½, then sold at $72½ cash, and $77 buyer 30, closing yesterday at $72.

Confidence (G. H.) rose from $65 to $75, fell to $62, rallied to $70, declined to 67½, and sold yesterday at $90. Sierra Nevada fell from $14 to $12, and closing at $12. Daney advanced from $15 to $22, and then sold at $20.

The total recorded sales of stocks, since Saturday last amounted to $921,201.00.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant thereof: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of such notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we a cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or paluted; the name of the ovenior should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are prepared them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
n appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, O. C	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

MINING BLANKS

For Sale

AT THE

OFFICE OF THE MINING AND SCIENTIFIC PRESS,

No. 505 Clay Street, corner of Sansome.

Blanks for Mining Companies, Secretaries, Shareholder, and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186, according to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]

Dated 186

Assessment Notice.

..... Company

.....

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ....., 186, an Assessment of .....per share was levied upon the Capital Stock of said Company, payable on the ..th day of .....186, in United States gold and silver coin to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186, to pay the delinquent Assessment, to gether with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.

Office.....

NOTICE.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186, the several amounts set opposite the names of the respective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophilus Thistle	23	14	$140 00
Peter Pipe	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ...., 186, so many shares of each parcel of said stock as may be necessary, will be sold at the.....

....., on ....., the ..th day of....., 186, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.

Office.....

☞ Our advertisers are furnished with blank Assessment Sale notices free of charge. Orders from the interior promptly filled by mail or express, as may be desired.

A Business Compliment.

PETALUMA, Oct. 4, 1865.

MESSRS. DEWEY & Co.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business-like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

Mining Summary.

CALIFORNIA.

The near approach of the rainy season always gives new life and impetus to business of every kind in California. Both the miner who digs deep into the earth for its golden treasures, and the agriculturalist who merely stirs and tills the upper soil, look with anxiety and interest for the annually recurring autumnal rains, which furnish the medium through which alone either can hope for success in the prosecution of their labors. The prospects, at the present writing, are especially favorable for an early and abundant presence of the needed element, and the hearts of all are buoyant with hope. Especially is this the case in our own State. Our exchanges for the past week are more than usually filled with mining items, recording progress in old workings, announcing discoveries of new placers and veins, and recording preparations for the usual winter operations for heavy sluicing and hydraulic washings.

Trinity County.—In this county, according to the *Journal*, the mining population has increased during the year—a rather notable feature of late in the mining districts of California. In some of the districts of this county new discoveries have been made. Important developments are reported on the North Fork, where a new camp has grown up and a large amount of gold has been taken out. Taylor's Flat, once abondoned, is now giving profitable employment to a large number of miners. A hundred men are at work on New River, where not more than a dozen were employed a year ago. The extension of the ditch taking water from Buckeye Creek is progressing—five miles are already completed.

In Shasta, according to the *Courier*, prospects are also brightening. Another rich ledge has been discovered by Mr. Farrington, near Whiskytown. What appears to be a very valuable discovery has also been made by Mr. Jas. Scammon, about three-quarters of a mile from the center of the town. It was discovered in an abandoned prospecting hole, by the side of the road, in which he found a rich specimen. On further examination, a very fine ledge was developed, similar in character to the Highland lode at French Gulch. The discovery being made known, the people became excited, and on Sunday and Monday the whole region of country between the stage road and the river was covered with notices of claims. The same paper says that the Morehead boys made another pleasant report on the 13th inst. of $1,287.27. On the 22d ult. they brought, as the result of twenty-five tons crushed, $1,620.84 Since that time the first-named amount has been taken out, and all with a little three-stamp mill, and the stamps nearly worn out at that.

Butte.—The Marysville *Express* chronicles the reception in that city, by Messrs. Rideout & Smith, of the snug little sum of $95,000 in bars, from some of the mining regions in that vicinity—locality not given.

Plumas.—The *Messenger* says that the claims of the Monitor company, at Saw-Mill Flat, are still paying well. One of the largest dump-sheds in Plumas county has been erected at these works, measuring 40 by 125 feet. Quite a little village has already sprung up about the works. Another company just below are bombarding the bed-rock, expecting to get gravel by Spring, when even more busy times at Monitor are expected.

The boys in the Old Branch claims, near Forest City, lately found a boulder in their ground that weighed twenty pounds, and was nearly all gold. The estimated worth is between three and four thousand dollars.

Nevada.—The Grass Valley *National* says that the Badger Hill company have "struck it very rich" in a narrow drift, on the main ledge, east from the shaft. They struck the main ledge on a raise in the bed-rock, in a narrow drift started to prospect the pitch of the new ledge, which runs some 30 or 40 feet under the present shaft, and which is in size from 8 to 20 inches. The depth of the drift from surface is from 60 to 70 feet.

Messrs. Loutzenheiser, McLaughlin, and O'Keefe are commencing the erection of a crushing mill on the Hartery claim. The mill will be in operation by the first of January next. Mr. O'Keefe has recently purchased a quarter interest in this claim from Mr. Loutzenheiser for $15,000.

The *Transcript* at Nevada says that an excellent quartz ledge has recently been opened by Edward Harvey and others at Wood's ravine. One hundred and fifty-three tons of rock was taken out and crushed at Sogg's mill. It paid twenty dollars to the ton. Another ledge near, and running parallel with the first, is now being prospected. The rock looks well, and the ledge will no doubt prove valuable.

The Oroville mill, now under the management of Mr. F. A. Miller, will be ready for custom-work by the 10th of November.

Placer.—According to the Folsom *Telegraph*, there is an unusual degree of activity manifested at the present time in that neighborhood, and along the borders of Placerville and El Dorado counties. The new machinery recently introduced for working auriferous dirt is pronounced a great success, and most important developments are soon expected in that direction. The *Telegraph*, speaking of the machinery, says: "After running through a ton of Willow Spring Hill dirt it realized about fourteen dollars. A ton of red dirt from the claim of B. C. Quigley has been run through, but not yet cleaned up, and we are unable to give the result. So well satisfied are the experienced miners of the success of 'Hodge's Amalgamating Press,' that two or three mills will immediately be erected in this vicinity. Any person desirous of inspecting the new process, can do so by visiting Quigley's steam works, in Folsom."

Arrangements are nearly completed for the erection of a first-class mill on the Layne silver claim. Five new mills for mining purposes will shortly be erected in the vicinity of Folsom.

Some of the richest decomposed quartz ever seen in Folsom may be seen at the banking-house of Palmer & Day. It is from the claim owned and worked by the above-named gentlemen, situated near White Rock, on the eastern limit of this county, and was formerly known as the Brooks' claim. The paying lode is about two feet in width, and the rock now being taken out—about four tons per day—it is believed will pay about five hundred dollars per ton. The rock is now being crushed by the mill attached to the assay works of Palmer & Day, in this place. The *Telegraph* is informed by Mr. Palmer that they intend immediately to erect a large mill on the ledge. Mining interests are decidedly improving in that neighborhood.

Work on several copper claims, among them the Mistletoe and Pequanna, and situated near Cotherin's store, on the line of the Placerville Railroad, is about to be commenced again. These claims are situated on what is believed to be the copper belt running from Copperopolis through Amador and the eastern portion of the county. The ores taken from the above claims, certainly denote as rich copper ore in the vicinity as any of the mines that have been fully opened, and from which fortunes are now being taken out in Calaveras county.

El Dorado.—A little over two years ago, says a Placerville paper, copper companies were being organized in this county by the dozen, and work commenced on quite a number of claims, and the most encouraging prospects were obtained. Then the stock panic swept over the country and operations almost entirely ceased; four companies withstood for a time the pressure, but eventually had to succumb with one exception—the Keystone Copper Mining Company, located at our neighboring camp of Cold Springs. This company have persevered against all obstacles, and pushed their prospect shaft to a depth of one hundred and eighty-five feet, until their enterprise has been crowned with success. It was in everybody's mouth on Saturday last—"have you heard the news?" "The Keystone has struck copper rich, full width of their shaft, over five feet," "good news," etc. Of course everybody was glad, and we are glad to be able to corroborate the good news that the Company has finally struck a vein of fine ore five feet in width. The mine is owned almost wholly in Santa Clara county, and by men of property as well as enterprise and pluck.

The effect of this strike is already creating a stir among the old locations, and in a few days work will again be resumed on many of the old shafts located on the same range.

Calaveras.—The San Andreas *Register* says that Messrs. Tubbs & Co. completed their mill and commenced to crush the rock from their lead last week. It learns that everything works well, and that they cleaned up after two or three days' run, and found that the rock pays them $25 per ton, and that, too, without using the steaming process, but simply the common method of crushing. This settles the question as to there being good paying quartz in that section.

The owners in a claim near by Tubbs & Co., called the Bay State, are about to resume work, and make a thorough prospect of the rock. It is believed to be a rich claim. Messrs. McGlynn and Eveuson are sinking on their lead, situated about a half mile from town, are taking out rock which is very heavy with mineral of some kind. The rock is full of sulphurets, which are thought to be full of gold. The Scifford claim is being worked with good prospects. Mr. Wm. Irvine is pressing work forward on his claim at El Dorado Camp. He has taken out some as rich looking rock as we have seen in this section. Work is progressing on numerous other leads, and everybody who is willing to work is employed.

The *Chronicle* says that in the neighborhood of Whisky Slide several parties are at work on lodes that promise well. At Musquito Gulch, claims that have laid idle for years are being opened. In the vicinity of West Point, quartz mining has long been profitable, while above, at Blue Mountain, the silver lodes are looking far better than before.

Mariposa.—The *Free Press* says that some of the copper interests in the Hamilton district have changed hands during the past week. Haskell has sold his interest in the claim and smelting furnace owned in connection with Snediker, Henry & Co. J. D. Crippen, and Charles Peck are the purchasers, Haskell is erecting a new furnace, on what is known as the Buchanan lode. "Quartz Johnson" has also been skirmishing in that neighborhood and is reported to have slid into some very promising claims, by purchase or other negotiation.

Tulare.—Clear Creek, says the Visalia *Delta* is still progressing rapidly, both in mineral discoveries and in the way of machinery necessary to develop those discoveries. During the past week an engine and boiler for a quartz mill, of capacity sufficient for twenty stamps, passed through town. It is owned by Mr. Donahue, and other wealthy men in San Francisco, and is intended to work leads which they have purchased. By the last steamer, two other mills went out *via* Los Angeles. We learn by a letter from Mr. C. G. Manning, of Havilah, that the parties who recently purchased a part of Mr. Sumner's leads are erecting a mill to work them, while a Mr. Pepper is putting up a twenty stamp mill, one and a half miles from town, calculated to work sulphurets of gold, which have heretofore been wasted, thus effecting a very large saving.

In the Long Tom District, at last, we have machinery such as its merits have long since demanded. A mill for the use of Messrs. Roberts, the present owners of the lode, has just passed through town, and we venture the assertion that the Long Tom will prove one of the best leads in the State. The owners have proceeded with great caution, and have not incurred the expense of machinery until entirely satisfied that they had "a rich thing."

Two gold bars, weighing fifty ounces, and valued at eight hundred dollars, were brought down by Mr. Hamilton, of Kernville, on Saturday last; they were from the Summer mill, worked by Messrs. Staples, and assayed by Mr. Piedler, of Kernville.

The El Paso Mining District is again attracting attention. It is situated some little distance northeast from Clear Creek, and has some very rich leads, such as the Tucker, Millikin No. 1, 2, and others. That they are rich, is undoubted; as to whether the facilities for working are such as to render them profitable, we are unadvised, but suppose the matter will soon be tested.

The *Delta* thinks there is not in the State such an opening for capital for mining purposes, as in Tulare county, at this time. No long continued and costly drifting, blasting, sinking of shafts, etc., is necessary. The moment the mill is erected and in running order, hundreds of tons of rich rock, paying even from the surface, are ready.

The latest information from these diggings states that seven mills are now on the way and in process of erection. The mill erected by Mr. J. H. Thomas, and now in charge of Mr. Stevens, worked, last week, several tons of refuse rock from the Bamboo lode—rock which had been thrown out as worthless, and the result was sixty-three dollars per ton!! Oh, no! there's no gold at Clear Creek! it's all in Nevada! We learn from Supervisor Jordan that two mills are also going up at Agua Caliente, which is near the northern extremity of Walker's Basin, and only some six or seven miles from Clear Creek.

VIRGINIA CITY AND VICINITY.

We have nothing of special interest this week from Virginia City or Gold Hill. The *Enterprise* says that ore of an excellent quality (argentiferous galena), continues to be brought in from the New Truckee district. The ore contains from $100 to $250 in silver; but no furnaces have yet been constructed which are properly calculated for a thorough and economical working of these ores. The discovery of a very rich silver vein is reported as having been recently found by a Mexican in Dog Valley, on the Henness Pass route over the Sierra Nevada mountains. The lead is narrow, but appears to be fast widening. The ore is of a soft black sulphuret, which crumbles readily in the fingers. Good judges of silver ore say that it will work $600 per ton. This is quite good enough.

An important sale is reported, to the effect that the Imperial Silver Mining company have purchased of Messrs. Lindauer & Hirschman their quartz mill and water-rights on the Carson river, at Dayton. This purchase was made on very favorable terms, and will not interfere with the regular dividends of the company, while it disposes of the litigation pending between the parties.

OWEN'S RIVER.

There is very little news from the mines of Owen's River, of special interest. In the Kearsarge District the company of the same name are prosecuting their labors with very cheering prospects. This is the only company doing any work, the others preferring to wait and avail themselves of whatever facts the Kearsarge company may develop. The new mines about "Hot Springs," about fifty miles from Aurora, are attracting the most attention. One poor affair of a mill, run by *hot* water, and with only four stamps, is clearing over one hundred dollars per day to its owners (the Diana company), out of third grade ore. All the mines in that vicinity certainly look very promising. There is quite a movement from Aurora and Montgomery district to the scene of the new discoveries, and new buildings are going up rapidly.

HUMBOLDT.

In speaking of the present condition and future prospects of the Humboldt, the *Register* says: "To the eye of faith, through which we have lived when the vulgar substantials were short, the prospect for the county is very good. There is no bustle and hum, and blatant sound of rushing business; but industrious men can see something to do in almost every line of industry. Good ledges are opening, and the mills are turning the rock into bullion. We hope, let us say in passing, that persons making shipments of bullion will notify us of the figures. More bullion is going now, to San Francisco, than ever before from this county. And, the machinery for producing bullion is continually multiplying."

We condense the following from the *Register*: Webber & Co., have made a contract with the Montezuma company, of Arabia, for a supply of ore for the smelting furnaces now building. The company is to deliver 2,000 tons of ore, which Webber & Co. are to smelt and cupel, making return of fine silver, at a cost of $50 per ton (of ore) to the company. The ore assays $212 to the ton. Messrs. Webber & Co., claim that smelting is the only true process of extracting the silver from the ore. [Such ores as that taken from the Montezuma, we presume.]

Stephenson's mill is now running, and works finely. Three more of Wheeler's pans have been ordered, to render the amalgamation machinery of equal capacity with the crushing power.

Nothing has been done in the San Jacinto district the past Summer. The *Register* says that the numerous excellent ledges in that district are mostly held by migratory prospectors, who have forgotten to come this season from California and attend to developing the ledges they had located; and adds that parties from that neighborhood are going into the district with the view of re-locating them.

In the Sacramento district things are looking well, and much confidence is felt in the substantial character of the ledges there. Montana rock has been sent to the Ætna mill, which yields $75 per ton, large quantities of which can be taken out. A large amount of the rock has been worked and the bullion forwarded to Virginia City. The Bigler company have run a tunnel some distance on their ledge, but work has now been stopped.

The Daniel Webster was located two years ago, and work has continued almost without interruption since the Spring of 1864. The Company has a contract out for a length of tunnel calculated to tap the ledge, at a depth of 250 feet. Work under this contract continues night and day, and it is expected they will be to the ledge about the 1st of February.

THE ARIZONA MINES.

Late mining reports from Arizona are very encouraging. We learn from the Arizona *Miner* that the Josephine lode, in Walnut Grove district, is turning out very well. The owners have sunk several shafts, and the rock is better the further they go. After running

fifteen hundred pounds of rock through an arastra, $150 were taken up—a good yield.

The two stamp mill of the Messrs. Bowers, on the Accidental mine is now ready for operation. Most of the owners in the original location have consolidated their claims, and will work together. The owners of the mill are known to be go-ahead men, and will certainly start it with all possible haste. In the last clean up from the arastras it yielded over one hundred dollars to the ton of rock.

Messrs. Tyson & Co., have completed the erection of their mill at Wickenburg, to work the Vulture mine, and it was to have commenced running on the 26th of September. A large quantity of rock has been taken to the mill, which, with the tailings from the arastras, will supply material for some time. Rich results are anticipated from this enterprise. Messrs. Curtin, Chase & Co., are making good progress in erecting their works, and expect to be crushing rock by the 1st of November. Col. Woolsey expects that his mill, which is run by water power, will be completed early in November. This mill is located in the centre of a net-work of lodes. Probably so many ledges, presenting such rich surface indications, were never before discovered in the same extent of country. Wherever shafts were sunk the lodes increase in width and richness, while new discoveries are made almost daily. The location of Vickroy & Co.'s mill is not yet determined. The din of its twenty stamps will soon however, be heard somewhere. Contracts have been let to sink shafts and take out ore from the Voucher and the Orion, two gold ledges, and from the United States, which assays richly in silver.

The Los Angeles *News* of a late date says that Mr. Goldwater of that city recently brought 270 ounces of gold dust from La Paz, which was taken out of the mines of that vicinity. It is but a short time since that Mr. Goldwater conveyed to San Francisco four hundred ounces of the precious dust, taken from the mines in the same locality. The mines of Arizona are "giving out," truly. Some of this gold is worth $17 50 per ounce.

NO SPECIAL CAUSE FOR ALARM.

It may be interesting to those persons who are wishing to leave San Francisco on account of earthquakes, many of whom desire to go to the Western States, to be reminded that on the 17th of August last, an earthquake shock was felt there which extended over all that portion of the Mississippi Valley, from the upper portion of Illinois to the lower portion of the State of Mississippi, embracing within its sweep portions of at least eight States, a space of territory much greater than that covered by the shock experienced here on the 8th instant. The centre of disturbance appeared to be near Memphis, Tennessee, where it produced quite a panic among the people, who rushed out of their houses in the utmost state of alarm. There, as in San Francisco, chimneys were thrown down and small articles upset; and we presume if there had been any shaky brick buildings in that region, their walls would have cracked and toppled just as the same class of buildings did here three weeks since. The water in the Mississippi, at Memphis and New Madrid, was so disturbed that the river was reverted for a brief space of time. This, it will be recollected, is the precise locality where the terrible earthquake occurred in 1811, a vivid description of which we gave last week, condensed from a paper recently published by the Smithsonian Institute. We have no record of any earthquake in California which equalled that in severity. There are but few places on the globe which are free from earthquake visitations. New England and the Middle States may be as free as any; but there is much less to fear from either San Francisco or Missouri earthquakes than there is from the lightning tempests of the Eastern States. The latter calls annually for many human victims; the casualties of the former have thus far been confined to property alone. There is danger everywhere, quite sufficient to warn us to be prepared at all times to meet the dread messenger, come when, how, or where he may.

Mechanical.

LUBRICATING RAILROAD CAR JOURNALS WITH WATER.

One of the most important problems which have recently engaged the attention of railroad engineers, is that which relates to improvements in the construction of the journal boxes for cars and engines, and the material employed for lubrication. This inquiry is of great practical interest to railroad companies themselves, from the fact that it involves an important item of economy in wear and tear, and cost of lubricating material; and is equally important to the traveling community, by reason of its involving one of the chief items in the matter of security from accidents. The cost of repairs of axles and boxes, added to that of the lubricating material employed, is quite a heavy sum in the running expenses of a railroad.

The skill of our mechanics has brought the construction of car wheel-boxes so near to the point of perfection, that but little hope is entertained of any further improvement in that direction; hence, inquiry has of late been turned to devising improvements in the lubricating material itself. Various unctuous compounds have been devised, but great deficiency is found to exist in the alterability or disposition on the part of any material of an oily or greasy nature to run into chemical changes, whereby it becomes more or less unfit for lubricating purposes. Under these circumstances, Messrs. Aerts & Bros., of England, have devised a box for the employment of water, or a lubricating medium, which has been put into operation on the Eastern Counties Railway in England, and on a Belgian railway, which terminates at Moerdyk, in Holland.

The result of the English trial is, that after the distance of a 11,249 miles had been run with the improved water boxes, in connection with the most approved oil apparatus, it was found that the difference in the wear and tear of axles and boxes was 77 per cent. in favor of Aert's water lubricated journal over those lubricated by grease. It is remarked that "during the trial each common box consumed eight pounds of grease, while Aert's box consumed hardly any." It should be remarked that the journal and interior of the box is thinly coated with grease.

The experiment on the Belgian railway is also pronounced a success; although the particular reference to that in the article before us is to prove the practicability of the employment of water even with the thermometer far below the freezing point. It is found in practice that ice around the journal presents less hindrance than a frozen mixture of metalic dirt and grease, or the pure congealed oil itself, for the reason that the adhesion of the ice is very slight, and when once broken, the ice itself forms a most perfect lubricator, much superior to the congealed oil; it is, moreover, much sooner reduced to a fluid state by the friction caused by the motion of the journals than the congealed oily mixture. The boxes are so constructed that there is only a very thin layer of water around the journal, which, when the cars stop in a temperature of extreme coldness, is soon converted into a glazing or varnish, which offers no perceptible hindrance to starting. We are not informed how the reservoir of water is kept from freezing, but are led to infer that it is so kept from the general success of the experiment.

The box is somewhat more complicated than the ordinary oil boxes, and costs a trifle more, but requires less attention, and soon pays for the extra cost in the economy of the lubricating material.

It is claimed by the the inventors that an extensive practical experience has enabled them to offer to the public a car wheel-box that leaves little or nothing to desire in the way of improvement, while it fulfills all the essential conditions of a perfect lubricator.

Water, under certain circumstances, has long been employed as a lubricator, and its merits fully acknowledged and appreciated. Its well known property of being neutral and unalterable, added to its cheapness and cleanliness, render its use a most desirable object. With it there is no thickening or gumming, by which much power is lost in the use of other lubricators. When to all other advantages we add the fact already set forth, that the wear and tear of journals and boxes is greatly reduced by its employment, we see no reason why it may not be generally introduced upon our railroads. We have seen no particular description of the mechanical construction of the boxes employed; but the success of water lubrication for rolling stock on railroads certainly appears to be fully endorsed by English and German engineers, whose attention has been called to its use; and if upon railroads, why not upon heavy stationary machinery as well?

THE ANNULAR DIAMOND DRILL.

This novel invention, to which we have several times alluded, is well spoken of by engineers at the East. It was lately on exhibition in Green street, New York, where it attracted much attention. It is thought by many that it will work a revolution in heavy drilling and boring operations. Although to the inexperienced eye, the annular drill, with its tiny diamond points, does not appear to be very well suited to work its way into the hard, rocky material of the earth's crust, still it is said, by those who have seen it work, that it is really far more effective than the hardest steel, driven by the sturdiest blows of sledge or hammer. It should be recollected that it works on the principle of an annular saw, boring a narrow channel around a core, which is subsequently broken off, and raised by the aid of suitable tools. An examination of these extracted cores, thus cut out of the hardest granites or slates, is said to be quite sufficient to satisfy even the most incredulous of its potent and most thorough effectiveness. It is said to work with the utmost precision, as well as with most extraordinary rapidity. One important advantage derived from its use, in addition to its effectiveness, is the fact that by enabling the borer to bring up consecutive sections of the solid rock through which he passes, a much more accurate determination can be made of the character of the same, including even its stratification. The proprietors of this invention are said to be actively employed at the present time in prospecting suitable frame work and other devices by which it may be successfully introduced, not only into well boring, but for horizontal working also in tunnels, drifts, etc. Should all that is claimed for it be found true in practice, the annular diamond drill will prove of such great utility as to insure its very general use for boring or drilling purposes.

An Invention.—H. R. Leonard, says the Sacramento *Bee*, has just finished the pattern of railroad car wheels and axles, embodying a principle which he claims to be new and important. The patent right has been applied for. This new arrangement is expected, when applied to railroad trains, to do away with all friction in making curves. All slipping would be avoided, and one wheel will accomodate itself to the speed of the others. The shaft or axle is cut in two in the center of its length. There is then put on a sleeve or cylindrical tube, three feet long, equally over the joint in the axle. One end of the sleeve is "shrunk" on to the axle. Stationary at the end of the sleeve and stationary on the other part of the axle is a stationary collar, over which a coupling is screwed, holding the two half shafts or axles together. Railroad engineers think the invention a valuable one, and that it will answer the purpose intended. In a short time tracks will be arranged for the purpose of exhibiting what the invention can do.

Important to Inventors.—In the patent case of Marcy vs. Protter, an appealed case before the United States Supreme Court, the Judge, in his decision, says: "The policy of the patent laws favors diligence and condemns neglect. It is the duty of an inventor, without delay, to patent his perfected invention. He has no right to use it himself, or permit others to use it, for any length of time, and then expect a monopoly from the public."

Preservation of Wood by Charring.—The superficial carbonization or charring of wood, as a preservative means, has long been practiced on a small scale, the *rationale* of the process being the formation of an indestructible skin of carbon, which is, moreover, impregnated with the empyreumatic oils and creosote, produced by the carbonization of the outer lay of wood. About two years ago M. Lapparent proposed to apply it to the timber used in the French navy. Some experiments which were undertaken with the view to determine its practicability have terminated, according to the *Reader*, very satisfactorily; and the Minister of Marine has ordered the process to be introduced into the Imperial dockyards. M. Lapparent makes use of a glass blow-pipe, the flame from which is allowed to play upon every part of the piece of timber in succession. By this means the degree of torrefaction may be regulated at will. The method is applicable to wood-work of all kinds, and the charring, it is said, does not destroy the sharpness of any mouldings with which wood may be ornamented.

Valuable Discoveries.—Two French discoveries of merit have been reported lately. One, which is authentic, enables copper smelters to utilize their pestiferous smoke so perfectly that Mr. Vivian, head of the greatest firm in Swansea, says he shall be able to turn out one thousand tons of sulphuric acid per week, restoring incidentally many thousand acres of land for cultivation. The other, which is less authentic, is a new mode of tanning in turpentine, said to be so rapid that twelve hours will tan a skin at half the former cost.

A New Ladder.—An interesting trial was made lately in the European city of Milan, with what the inventor calls an "air ladder." It consists of several pieces, which, a sort of carriage as a basis, can be fixed one on the top of another. A height of 90 feet was thus reached in a very few minutes. The apparatus may be beat down to an angle of 45, and is capable of carrying heavy weights. The principle, it is stated, can be adapted to portable bridges, which can be put together in an equally short time.

The Cholera.—Considerable apprehension is felt at the East lest the cholera, which is making fearful havoc in many localities in Europe, should cross the ocean in the spring, and bring death and destruction once more into the midst of our Atlantic cities. It has already made its appearance in England. Very little fears of such a visitation, however, need be felt in any well regulated and cleanly kept city, and the strong, pure sea breezes which so constantly sweep over San Francisco, with the most ordinary precautions of cleanliness, will prove an effectual check against its appearance here. We may have an earthquake now and then; but need entertain no fear of the cholera. San Francisco earthquakes have never been known to kill any one; while the cholera demands its victims by hundreds, if not thousands, when it gains a foothold in a great city. Earthquakes, then, are preferable to the cholera.

Navigation of Eel River.—It appears that measures are being taken to open regular communication between Eel River, Humboldt county, and this city. The Eel River Navigation Company has been organized for this purpose, with a capital stock of $37,500. This stock has, doubtless, been taken with reference to the future importance of the oil interests of that region.

One locomotive belonging to the Sacramento Valley Railroad Company, is now running one hundred and sixty-four miles every twenty-four hours, and another, over one hundred and twenty miles, over the Sacramento Valley and Placerville road, propelling freight.

The Fair Medals.—We are requested to state that the medals awarded by the Executive Committee of the late Fair of the Mechanics' Institute, are now ready for distribution. Apply at the rooms of the Institute, between Montgomery and Kearny streets.

At the Waverly gold mines near Halifax, Nova Scotia, 1,200 ounces per month of the precious metal is taken out, yielding the proprietors a profit of over $1,200.

A correspondent of the Dundee *Advertiser* says that a petroleum spring has been discovered at Blairgowrie (Scotland).

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Oct. 28, 1865.

STEAM-BOILER EXPLOSIONS.

The late terrible steamboat accident on the Sacramento river, has caused much earnest thought and greatly stimulated inquiry into the probable cause of certain classes of steam-boiler explosions, which, by almost universal consent, are referred to other than the usual causes of neglect in the management, or imperfection in the material or manufacture. In view of the tens of thousands of lives that are constantly in jeopardy, from the subtle, yet terrible force of confined steam, it is certainly a matter of no little astonishment that so little has been done, experimentally, to learn the true nature and condition of steam under the numerous extraordinary conditions in which it is liable to be placed in the countless localities and circumstances in and under which it is employed in the various uses of civilization. The internal pressure required to rend a steam boiler may be very closely calculated for any given size of boiler, or thickness of plates, and every engineer has constantly at hand the means of ascertaining almost precisely the amount of pressure he may have upon his boiler; yet it often happens that when all the known conditions of safety are fully complied with, the most terrible and destructive explosions occur.

There are quite well authenticated cases of explosions which have occurred when, but a moment before, the water guages have indicated an ample supply of water, and the steam guages have assured the engineer that his degree of steam pressure is far within the limits of mathematical safety, under any known and well understood condition of steam. These facts appear to be so well authenticated as to fully justify the assumption of some violent internal action, which must take place at the instant preceding the actual rupture of the boiler—the rupture being regarded as the consequence of such action, and not the result of mere statical pressure. In hypotheses of this kind various causes have been assigned for the effects produced, among which are—

1st. A sudden production of steam from some cause or other not dependent upon the regular induction of heat from the furnaces.

2d. Decomposition of steam and subsequent detonation of hydrogen, in the presence of oxygen, or otherwise.

3d. The spheroidal condition of the water in the boiler.

4th. Electrical action.

Without committing ourselves to the acceptance or rejection of any one or more of the above hypotheses, we propose to consider, in future numbers, the probabilities or otherwise the of various explanations which have been given by prominent writers on these matters, and to lay before our readers whatever of especial interest upon this subject, or interesting and important to mechanics and the public generally, we may be able to glean from authorities at our command. Engineers, everywhere, and learned men as well, are much more ignorant upon these things than they should be. Experimental science has, within a few years past, brought some things to light, the practical value of which, or the exteut to which they may actually come into operation, is not yet fully known. It is well, however, that engineers should be in possession of all that *is* known, to the end that they may exercise more care to avoid the possibility of such casualties as have so frequently, of late, spread mourning and dismay over communities.

CITY TEACHERS' INSTITUTE.

We had the pleasure of attending the monthly meeting of this body on Thursday evening. Under the new rule of the Board, the Principals of the various Grammar Schools take charge of the Institute in turn. This being the first meeting under the new order of things, Mr. Marks, of the Spring Valley School, appointed by the Superintendent for the occasion, set out with a determination to make the meeting one of interest; and that he succeeded, the frequent and hearty applause of the large audience abundantly testified.

Mr. M. opened the exercises by stating that as he believed in and loved his vocation, he had determined to make the exercises of the evening "disgustingly practical," and to carry out this portion of the programme, after a song by the Institute, he called upon Mr. A. B. Andrews, teacher of writing in the public schools, who proceeded to give some interesting and eminently practical hints in regard to teaching his favorite art. This was followed by a song from the "Twelve," and a very fine essay by Mrs. Griffiths, of the Union School, the highly popular "Occasia Owen" of the *Golden Era* in which, though on the rather unpromising subject of primary teaching, she fully sustained her high literary reputation. This was followed by a song from Mrs. Marriner, which was received with rapturous applause, after which the Rev. J. D. Strong made some very stirring remarks on patriotism in the schools, followed by another song by the "Twelve," select readings by Miss Hitchinge, and the recitation by Mr. Burnell, Principal of the Latin School, of the celebrated soliloquy on death, from "Hamlet," when, after a few remarks from Superintendent Pelton, congratulating Mr. Marks and the Institute on the successful character of the exercises of the evening—the meeting adjourned. Such meetings as this fill a place in our social life which has long been vacant. The teachers have been left to the society of themselves and the children, until it has seemed in some cases that they had lost their place in the social economy and belonged to a different race; but through the influence of such meetings as this, together with their increased salaries and abridged hours of labor, they are fast beginning to take their proper place in the social scale. We believe it is principally owing to Teachers' Institutes that the social position and influence of the teachers of San Francisco, are higher and more extensive than those of the Public School teachers in almost any other city in the world.

COMMERCE WITH THE SOUTH.—According to the New York *Express*, there are *three times* as many steamers running between that port and Southern ports as could he counted before the rebellion. The commercial journals contain advertisements of steam lines connecting New York with almost every important Southern port. There is also a great revival of steam communication between New York and foreign ports.

THE CHOLERA.—It is estimated that upwards of 50,000 lives had been lost in Constantinople at last accounts from that city. The daily mortality was variously estimated at from 1,500 to 2,500, and according to newspaper reports, the stench from imperfectly buried corpses was almost intolerable.

INTERESTING FROM THE COLORADO.

We have just been placed in possession of some very interesting intelligence from El Dorado Cañon, in the Colorado, by our attentive correspondent Mr. Frank S. Alling, who arrived in this city on the Senator on Saturday last. Notwithstanding the great delays and inconvenience to that locality growing out of the hitherto unreliable and irregular character of transportation from this city, the miners there are hopeful and perfectly confident of the future. The Colorado mill is now busy at work upon Queen city ore. The results of the crushing is kept private; but our informant, who resides near the mill, has seen the result of several cleanings up, from which he is satisfied that the ore is paying remarkably well, and the amalgam taken out is as fine as is ever met with anywhere. It contains a large percentage of gold. The New Era mill, is also about ready to start up again on Techatticup ore.

NEW AND RICH DISCOVERIES REPORTED.

Just previous to the departure of Mr. Alling parties arrived from Callville, a settlement on the Colorado, about thirty-five miles above El Dorado Cañon, who reported that letters had been received at Callville stating that some extraordinary silver discoveries had recently been made on Mud Creek, a small stream emptying into the Rio Virgin, about four days travel north of El Dorado Cañon. The veins are reported to be of extraordinary richness, similar in character to the rich mines of Batopolis, in northern Mexico, and like them carrying large quantities of native silver.

These mines, it is supposed, are the same as those reported by a company of miners who, having lost their way about a year and a half ago, in that region, discovered some very rich silver veins; but could never find them afterwards. The present discoverers are probably some Mormons, from the Muddy settlement, a Mormon town some distance to the south. Quite a number of miners from Arizona have also now gone in and secured some fine locations. The letters referred to as being received at Callville, are from some of these Arizonians asking their friends to come up immediately. A company was made up at once at Callville, and several agents sent out.

The first intelligence of this discovery is reported to have been sent to Salt Lake and it is said that a large amount of money with machinery for a mill, has gone from thence to these new mines. These reports were causing much excitement at El Dorado Cañon when our informant left. The locality is very near the dividing line between Utah and Arizona; the Mormons claim that it is in Utah, while the Arizonians are of the opinion that it belongs to their territory.

IMPORTANT TO NON-RESIDENT MINE-HOLDERS IN EL DORADO CANON.

Mr. Alling informs us that there are a large number of valuable mines scattered through El Dorado Cañon, and owned by non residents, which are being neglected, and most of which have been forfeited by the laws of the district. On many of these claims short tunnels have been run, shanties put up, and mining tools of various descriptions, such as picks, shovels, blacksmith tools, drills, steel, powder, etc., left on the premises, with no one to look after them. The Indians have of late been prowling about there, and have stolen such of the powder as they could readily find, stripped the cloth from many of the shanties, cut the leather from the bellows, to make into moccasins; and probably some white men may have appropriated such tools as they needed to work with. To say nothing of the bad policy of putting powder in the way of Indians, which they may, and doubtless will use to shoot white men with, we should suppose that parties interested (and they are mostly residents of this city) would take some measures to preserve their property and look after their mining interests. The resident miners of the cañon have recently determined that the laws of the district shall be enforced, and that non-residents, who own the most of the valuable claims, shall not be allowed much longer to hold them to the prejudice of the district. It is for the interest of all parties that they should be worked. Some have already been re-located, and others soon will be, unless prompt measures are taken to comply with the rules for holding them. The resident miners have resolved to stand by one another in carrying out these measures, and we have been requested to give this "fair warning" to all outsiders interested, that they may govern themselves accordingly. There can be no doubt of the ultimate value of these mines. It is said that fully six-sevenths of the mines in the cañon are in the position of abandonment above described.

REGULAR COMMUNICATION TO BE ESTABLISHED AT ONCE.

Recent developments have so fully satisfied capitalists in this city of the value of the mines of that region, and its future commercial importance, that Captain Trueworthy, who is now here superintending operations, has finally succeeded in the complete organization of a transportation company, with all the capital that may be needed to put on a line of sailing vessels to connect with the steamers on the Colorado, that shall be sufficient to meet the fullest demands of the commerce of that river, as fast as it shall be developed. The company will be known as the "Pacific and Colorado Steam Navigation Company." They own the Esmeralda, which is now on the river at Fort Yuma, and have quite recently bought the Nina Tilden, now at the mouth of the Colorado, awaiting the arrival of the schooner Toando, which has just left this city with a full freight. The Toando, will soon be followed by another sailing vessel for the same destination. The company have four barges on the river, which, with the steamers, are calculated to go up as high as Callville, and will land passengers and freight at any point between that place and the mouth of the river. This company has been organized with especial reference to accommodating the mining public, and parties forwarding merchandise and machinery can depend upon its direct and regular transit. Capt. Trueworthy is deserving of much credit for the enterprise and energy he has displayed in establishing this company, under circumstances of most peculir discouragement. Parties in this city interested in mines in the cañon, will do well to take early steps for securing their interests against any possibility of interference from jumpers. The opening of permanent navigation will give an immediate value to their claims, and should operate as a further inducement to their prompt development.

SAN MATEO INSTITUTE.—We have received the annual circular and catalogue of the San Mateo Institute, presented in a neat little pamphlet of sixteen pages, from the press of Dewey, Waters & Co. The object of this Institute is to afford young ladies the opportunity of acquiring a practical as well as an accomplished education. The arrangement of both the literary and domestic department is such as to combine all the advantages of a home education with those of a well-appointed academic Institute. The location has been most happily chosen, just far enough removed from the city to be beyond any improper metropolitan influence, and yet within easy reach for parents and friends—a locality noted for its pleasant scenery and delightful climate, and directly on the line of the San Jose and San Francisco railroad. We notice in its "Register of Pupils" young ladies from almost every portion of the State. The Institute is under the immediate charge of Miss L. A. Buckmaster, as principal, assisted by a large and able corps of assistants in the various departments.

THE *Pacific* very significantly remarks that scores will nightly sleep upon our steamers without apprehension, while hundreds in the city will be wakeful, for fear of earthquakes. Yet earthquakes have not destroyed a life in years, while steamers have killed their hundreds within a score of months.

DECOMPOSED quartz that will yield $500 per ton has been found near White Peak, in Sacramento county, says the Folsom *Telegraph*.

THE REPORT OF THE STATE GEOLOGICAL SURVEY.—One hundred copies of the first volume of the printed reports of the State Geological Survey were received by the Colorado, the past week—price, $3.50 in cloth, or $6.50 in half-Turkey morocco, with gilt top. The volume consists of 240 pages of text, with 32 plates on steel and stone. It is entirely devoted to the palæontology of the State—the fossil remains of the animals who have formerly lived, died, and become extinct during the great convulsions of nature which, in early geological periods overturned the original horizontal strata which probably then existed throughout this region, and left it, with its strata, tilted, contorted, and overthrown, presenting the contour and topography of what is now known as California. To the scientist this volume will possess a most unusual degree of interest, and will probably be sought after with much avidity in Europe, as the first authentic index of the character and age of the California rocks. The second volume, which will contain a portion of the geological work of the survey, has also been printed, and will be brought out by Professor Whitney himself, who is expected to arrive about the first of December. This volume will, doubtless, be of much more interest to the general reader than its predecessor, and, in fact, the most interesting of the series.

Mr. Gabb, the palæontologist of the survey, has made all the drawings and written the description of the cretaceous and triassic fossils; F. B. Meek described the carboniferous and jurassic fossils, which Professor Whitney, as the head of the Survey, has had a general oversight and supervision of the whole work. The other volumes cannot be published until further appropriations have been made by the Legislature for that purpose.

YUBA COUNTY GOLD.—Yesterday, Messrs. Knight & Co., assayed gold to the amount of $8,305, the product of ten days run of the mill of the Jefferson Company, at Brown's Valley. *Marysville Express, October 25th.*

THE Copperopolis *Courier* estimates that next year the copper mines of that county will produce 20,000 tons of shipping ore per month.

IMPORTANT MINING ENTERPRISE.—The Shasta Courier says: That some time since we noticed that a company had been formed for the purpose of tunneling through a point on the Sacramento river, at Horseshoe Bend, by which they would drain some three miles of the water bed, supposed to be good mining ground. The tunnel is through and strikes the river seven feet below the surface of the water at its lowest stage, or five feet below the lowest part of the bed of the stream. It is eight feet wide at the bottom and six and a half feet high, and of capacity sufficient to carry more than three times the quantity of water now in the river. In two or three days more the tunnel will be completed in every particular, and the travel of the waters of the Sacramento shortened by at least three miles.

ADVENTUROUS TRAVELERS.—A party, composed of Count Thun and his servant, Major Prossig and Major Preiss, will leave this city next week in the Hamburg barque *Perle*, bound for Callao, whence they will start, overland, through Bolivia, and round or through Paraguay for Rio Janeiro, where they expect to arrive next spring. A large portion of their journey will be through country seldom visited by Europeans, and some of it entirely unexplored. All of them are travelers of experience and men willing to encounter the hardships, privations and dangers which such a trip implies.

Terms of Subscription.

THE MINING AND SCIENTIFIC PRESS is published every Saturday morning (containing sixteen pages—size of *Harper's Weekly*) at the following rates:

One copy, one year, by mail, in advance	$5 00
One copy, six months, by mail, in advance	3 00
One copy, one year, by express	6 50
One copy, six months, by express	3 50
Five copies, one year, by mail, in advance	20 00
By city carriers, per month	50
Single copies	12½
Monthly Series (or parts), containing 4 Nos	50
Monthly Series, containing 5 Nos	62½

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising

DEWEY & CO., Proprietors,
Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

Just and True Economy
IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

DEWEY & CO.,
4v11 Office Mining and Scientific Press.

QUARTZ OPERATOR'S
HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.
BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Eeginer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

New Volume
— OF THE —
Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).

PUBLISHED BY
DEWEY & CO.,
Patent Agents, Publishers and Job Printers,
505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

☞ BOUND VOLUMES FOR SALE. ☜

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)	$5.00
Six Months, (one volume)	3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

OFFICE—No. 505 Clay street, corner of Sansome.

DEWEY & CO., Publishers.

C. W. M. SMITH .....W. B. EWER .....A. T. DEWEY

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,
Publishers Mining and Scientific Press.

OUR NEW YORK AGENCY.

MR. GEO. M. NEWTON is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "STOCKHOLDER," No. 72 William street.

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, MR. TURNER HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

Traveling Agent.

MR. ROBERT LATTIMORE is now on a canvassing tour for the Press through Butte, Colusi, Tehama, Shasta, and Siskiyou counties, and we recommend him to the favorable consideration of our friends.

To Blacksmiths.

An excellent, strong lad, from the interior, 17 years of age, desires to learn the Blacksmith's trade. His parents wish him to engage with a reputable firm, and learn his business thoroughly. Address, or inquire at the office of the MINING AND SCIENTIFIC PRESS. 2v11tf

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

How to serve a Dog.—A correspondent says this is the way: "When attacked by a bloodhound or any other dog, raise your left arm and let him seize it; then instantly grasp his windpipe with your right hand, squeeze it with all your might; that will disable him in two seconds. He opens his mouth to gasp, loses all power, and falls helpless. If you wish to kill him, keep your hold for a minute or two—he is done. You are ready for another. One at a time is all you need. I speak from experience with big dogs."

Idaho Quartz.—The *Statesman* claims for the quartz mines of Idaho, that arsenic, antimony and sulphur are almost unknown, and that the simplest process answers for its treatment. Capitalists are becoming interested largely in the ledges about Idaho City.

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

UNION IRON WORKS!

Corner First and Mission streets,
SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. B. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wakice's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills. Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices. 2Iv10

H. J. BOOTH & CO.

Miners' Foundry
—AND—
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,

Machinery, Mining Pumps, Amalgamators,

Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities. FREE OF COST.

All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.

HOWLAND, ANGEL & KING.

Vulcan Iron Works Company

[Removed from Oregon street, between Front and Davis.]

A Good Idea.—Among the school books used in France is one entirely unknown in this country, consisting of *fac similes* of letters written by business men, eminent people, etc., intended to teach children the art of reading writing, of which there is almost universal ignorance in America. Every variety of hand is selected, beginning with the best, and gradually proceeding to scrawls which puzzle printers and "blind letters" men in postoffices.

It is estimated that the Peace expenses of the Government will amount in the aggregate to about $110,000,000 annually, while the income will, under present laws, amount to some $300,000,000.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev A. Maraschi, St. Ignatius College, Market street, San Francisco.

3v11 REV. A. MASNATA, S. J., President.

CALL STABLE.

N. GISHWILLER

Would respectfully inform the public that he has opened a large and well-arranged LIVERY STABLE,

On B street, Summit City, Cal.,

(two doors below the Lake House), where good Saddle and Buggy Horses can be had at all times. Our charges will be reasonable, and we hope, by prompt attention, to merit a share of the public patronage. 10v11-3m

Dissolution of Partnership.

NOTICE IS HEREBY GIVEN, THAT THE PARTNERship heretofore existing between the undersigned, under the name and style of Fisk & Barber, and doing business as Grocers, is this day dissolved by mutual consent. The business will hereafter be conducted by Fisk & Brown, at the old place, 811 Howard street. The business of the old firm will be settled by Fisk & Brown.

J. M. FISK.
CHAS. J. BARBER.

San Francisco, Sept. 30, 1865. 15v11-4t

LICK HOUSE,

Corner of Montgomery and Sutter streets,

SAN FRANCISCO.

S. ALSTROM AND G. S. JOHNSON, Prop'rs.

This elegant and commodious Hotel is situated on the principal promenade street of San Francisco. The Lick House is finished and furnished with a degree of beauty and excellence unsurpassed, combining all the modern appliances and arrangements of a FIRST CLASS HOTEL, thus offering superior inducements to the traveling public. The proprietors assure their patrons that the Lick House shall not be excelled in any of its appointments, or in polite attendance or attention to all the comforts of its guests. 15v11

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

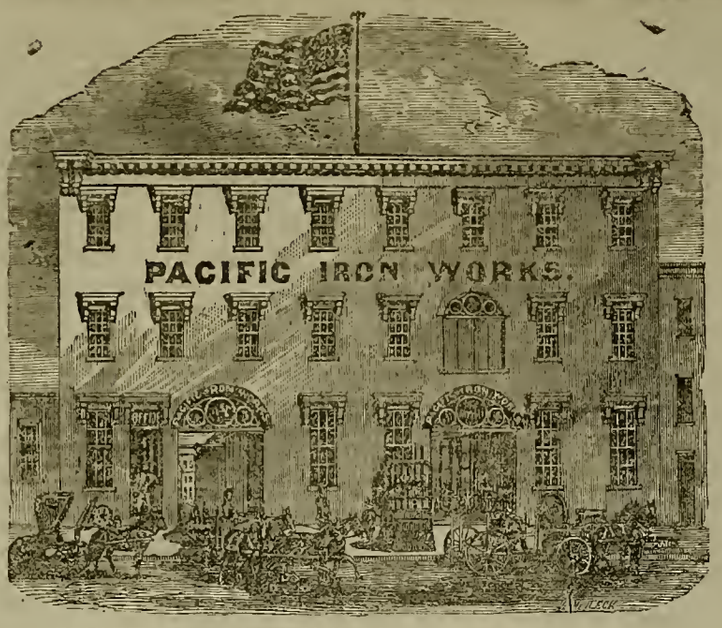
The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with OAL-LAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11 3m



THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

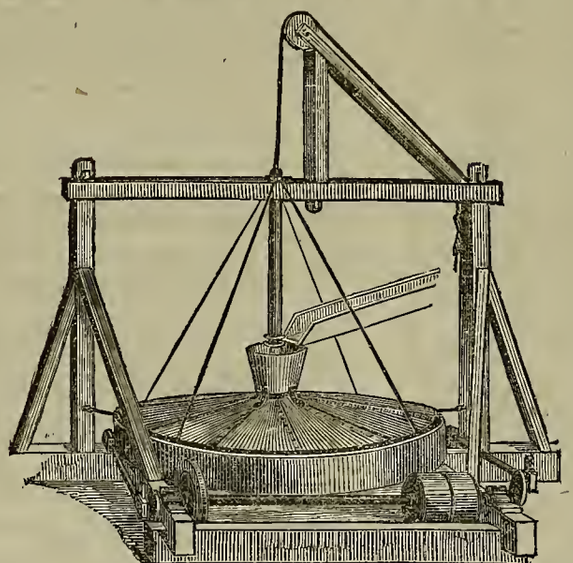
GOLD AND SILVER ORES.

UNDENIABLE FACTS FOR THE MINING PUBLIC.

At the Exhibition in the Fall of 1864, the Mechanics' Institute awarded a Premium to

E. B. PRATER,

FOR THE BEST CONCENTRATOR.



The proprietors of this Concentrator feel satisfied that, with the latest improvements, IT HAS NO EQUAL IN USE. Large numbers of these Machines are now in successful operation in different parts of this State, Arizona, Nevada Colorado, Idaho, and Mexico. One of these Concentrators can be seen in operation at the San Francisco Foundry, northeast corner of Fremont and Mission streets.

The Prater Concentrator was invented at Washoe in the year 1863, and patented December 6, 1864; since which time it has got into successful operation, as above stated, and as an evidence of its worth, orders frequently come from those who have used them. The following telegraphic dispatch has just been received by the Fulton Foundry, from one that got a Prater Concentrator about four months ago:

PORTLAND, Oregon, August 3, 1865.—Send one of Prater's Concentrators by first steamer. A. C RIPLEY.

Two Concentrators were ordered on the 26th August, 1865, for the Buell Mill, Austin, Reese River District, by J. B. Murphy, who has been using them over twelve months

Circulars sent free, giving description and reference as to working, etc., on application to

FROM AUSTRALIA.—The British barque Antevida arrived at this port on Thursday from Newcastle, N. S. W., after a voyage of fifty-eight days. The only mining news we have been able to gather is contained in the two following items:

The rush to the Grey River district is turning out well. No less than 15,500 ounces of gold were received in Nelson within a week, from the Hakitika and Gray diggings.

The amount of gold received at Sydney during the week ending August 18th, was 4,905 oz., 12 pwts., 18 grs.

THE MARIPOSA ESTATE.—The Mariposa *Gazette* says: That the Mariposa estate is superintended by Dodge Bros., San Francisco, on behalf of the creditors in that city, while Howard A. Martin, clerk under Mr. Olmstead, assumes control of all business pertaining to the Mariposa Company. Mr. Olmstead has gone East.

It is stated by the fishermen that after the earthquake no fish would bite for a consideable length of time. An exchange remarks that they probably lost their appetites, as many men did. If the fish got such thumps as was delivered upon the bottoms of the vessels in the harbor and near the Golden Gate, it is no wonder they lost their appetites and wouldn't bite.

Ex-Gov. BROSS, of the Colfax party, in a letter to the Chicago *Tribune*, predicts that "the child now lives" who will see San Francisco the largest city on the continent.

MOUNDS of gypsum, highly impregnated with sulphur, have been discovered near Silver Peak, in Lander county, Nevada.

THE Placerville "Recorder" favors the calling of a Miners' Convention in El Dorado county.

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

Eagle Quartz Mining Company—Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of October, 1865, an assessment of seventy-five (75) cents per share was levied upon the capitel stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 605 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 11th day of December, 1865, to pay the delinquent assessment, togothor with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOHN M. BURNETT, Secretary.

Office, 605 Montgomery street, San Francisco, Cal oc28

Emilia Mining Company, State of Guerrero, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of October, 1865, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 55 Montromery Block, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be mede before, will be sold on Saturday, the 9th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

T. B. CUNNINGHAM, Secretary.

Office, No. 55 Montgomery Block, San Francisco, Cal. oc38

Honest Miner Gold and Silver Mining Company, Lander County, Nevada.

NOTICE.—There are delinquent upon the followiug described stock, on account of assessment levied on the 28th day of September, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.
Allen, H H	bal of 294	6	$3 00
Chevers, W H	46	6	3 00

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco. oc28

La Favorita Mining Company, Montezuma District, Sonora, Mexico.

SAN FRANCISCO, Oct. 25, 1865.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of October, 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable on the 25th day of October, 1865, in gold coin of the United States of America, to the Secretary, at the office of the Company, 429 Sacramento street, in the City of San Francisco, Cal.

Any stock upon which said Assessment shall remain unpaid on the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 9th day of December, 1865, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees.

E. WASSERMAN, Secretary.

This assessment will liquidate the Company's indebtedness in full.

E. WASSERMAN, Secretary.

Office, 429 Sacramento street. oc28

Santa Cruz Petroleum Oil Works Company, Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of October, 1865, an assessment (No. 14) of forty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, R. WEGENER, 415 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Thursday, the 14th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

R. WEGENER, Secretary.

Office, 415 Montgomery street, San Francisco, Cal. oc28

Southern Light Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 7) of fifty cents per share, levied September 25th, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

By order of the Board of Trustees.

SAMUEL P. HOWES, Secretary.

Office, No. 2 Odd Fellows' Hall, San Francisco, Cal. oc14

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Maria Silver Mining Company, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of October, 1865, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, in this city.

And in accordance with law, and an order of the Board of Trustees, made on the 19th day of September, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Doro & Co., No. 327 Montgomery street, San Francisco, on the 6th day of November, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. H. BEWLEY, Secretary.

Office, 323 Montgomery street. oc21

Old Colony Gold and Silver Mining Company—Location of works, Austin, Reese River, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of an assessment levied on the 12th day of September, 1865, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
F J Tuibault	41	40	$240 00
H F Cutter	35	50	300 00
H F Cutter	39	25	150 00

And in accordance with law and an order of the Board of Trustees, made on the 12th day of September, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at 523 Montgomery street, San Francisco, on the 25th day of October, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. O. HOWARD, Secretary

Office, No. 523 Montgomery street, San Francisco.

POSTPONEMENT.—The above sale is hereby postponed until Wednesday, November 1st, 1865, at the same hour and place. By order of the Board of Trustees.

oc21 H. O. HOWARD, Secretary.

Oroville Gold and Silver Mining Company, Oroville, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of October, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 434 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 18th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 2d day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

oc14 ROBT. P. LEE, Secretary.

Notice.—The Stockholders of the San Fernando Petroleum and Mining Company are requested to attend a meeting at the Office of the Company, on the first Monday in October, for the purpose of electing officers for the ensuing year.

A. N. CLARKE, Secretary.

ADJOURNMENT.—The above meeting was adjourned by a minority of the Stockholders, to the first Monday in November.

A. N. CLARKE, Secretary.

Office, 121 Montgomery street, San Francisco. oc7td

Wide West Mining Company, Esmeralda District, Esmeralda County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of October, 1865, an assessment of five ($5) nollars per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 103 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 18th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. P. DAVIS, Secretary.

Office, 103 California street, San Francisco. oc21

Walipi Gold and Silver Mining Company, (Moss Lode,) San Francisco Mining District, Arizona Territory.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 12th day of September, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

"Don't Give up the Ship."—This forcible and beautiful expression, attributed to the gallant and lamented Lawrence, as an exclamation to his lieutenant, when the men were carrying him below after his fatal wound was received, is said to have been changed, for poetical effect, by his historians, from the less elegant but more forcible expression of "Never strike the flag of my ship." The widow of this gallant officer recently died at Newport, on the 52d anniversary of her husband's funeral.

One of the best posted wine makers at Cleveland, Ohio, says that if for five years to come the people of this country plant vineyards as they have for five years past there will be more wine and grapes in the United States than in Europe.

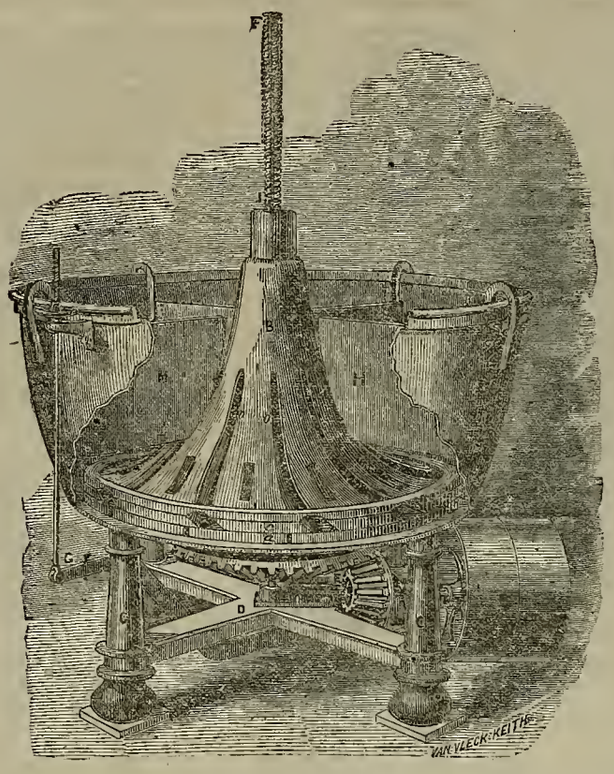
To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINing Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.

San Francisco, Oct. 12, 1865. 15v11tf



THE EXCELSIOR

GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

NATIONS WITHOUT FIRE.—According to Pliny, fire was for a long time unknown to some of the ancient Egyptians; and when Euxodus (the celebrated astronomer,) first showed it to them, they were absolutely in rapture. The Persians, Phœnicians, Greeks and several other nations acknowledge that their ancestors were without the use of fire, and the Chinese confess the same of their progenitors. Pompanius Mela Plutarch and other ancient authors, speak of nations, who, at the time they wrote knew not the use of firo, or but just learned it. Facts of the same kind are also attested by several modern nations. The inhabitants of the Marian Islands, which were discovered in 1551, had no idea of fire. Never was astonishment greater than theirs when they saw it on the descent of Magellan in one of th ir islands. At first they believed it was some kind of animal that fixed to and fed upon wood. The inhabitants of the Philippine and Canary Islands were formerly equally ignorant. Africa at present, even in our day, is in the same state.

A NEW LAKE HARBOR.—Indiana has only ten miles of lake shore, but it is proposed to make the most of it by excavating a fine harbor at Michigan City, at an expense of $3,000,000. There was recently a convention at that place to see about it.

Machinery.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Grecoville Quartz Crusher; his Pulverizer; and his improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,

24v9

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

JOHN MAILER,

Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco

23v10

Rowe's Patent Æolian Refrigerator.

THIS NEW AND IMPORTANT INVENTION IS NOW offered to the public, with the fullest conviction that it will be found invaluable in vented such a Reel as his, in 1862 or 1863, and had not improved it more than he has, I would keep my name to myself, and not let the public know who I was. His notice puts me in mind of Shakspeare's play of "Much Ado About Nothing." My Reel is entirely different from his, and is considered, by operators who are judges of such things, to be the best; and as for the cord, I could rig one to my Reel that would run a week, but it is not necessary.

For the best Paper Reels, address

L. W. WORTH, Sonoma,

15v11tf Or, WM. LUNDBERG, San Francisco.

HUNTER'S PREMIUM CONCENTRATOR, AMALGAMATOR AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste tree gold and amalgam is amalgamated on the copper plates; no loss of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,

15v11-3m Or to R. T. STEEN, Agent.

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, & less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 861.]

Great Improving in Blasting.

W. B. LAKE

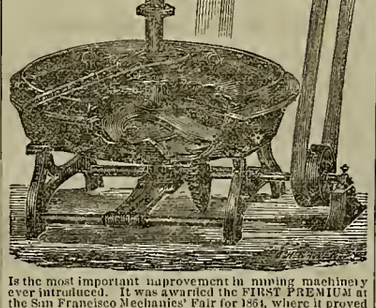
Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.

D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ¾ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

BAUX & GUIODS Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIODS Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

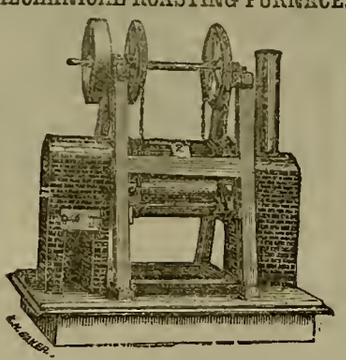
Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Keugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

The Mechanics' Institute AWARDED A PREMIUM SILVER MEDAL TO BRUCKNER'S MECHANICAL ROASTING FURNACE.



Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

12v11 416 Market street, San Francisco.

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

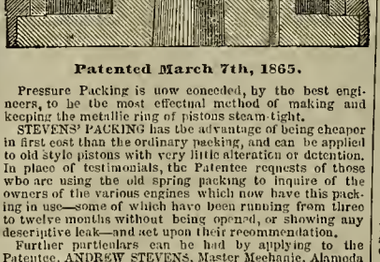
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

STOW'S PATENT CHAMBER DRILL.

The greatest Labor-saving Machine ever invented for Quartz Mining. By using this Drill in shafts, tunnels, and all other rock blasting, three-fourths of the labor and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 1½ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, September, 1865, a Committee, after examining both the Lipscott's and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for blasting rock, for the following reasons:

1st. For simplicity of construction;
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for $30, with one set of Cutters or Chisels that will chamber from 15 to 150 holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 7 Government Block, corner Sansome and Washington streets, and at No. 541 Market street.

Drills will be delivered to any part of this State free of expense to the purchaser. Any information desired, or orders for Drills, address

STOW & COLLINS,

San Francisco.

Oil Wells! Oil Wells!!

I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ¾ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to and work with any common drill at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

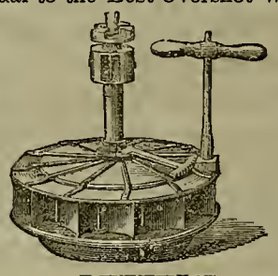
HENRY M. STOW,

14v11 San Francisco.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED



IN EXISTENCE.

LEFFEL'S AMERICAN DOUBLE TURBINE,

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,

At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the

PACIFIC FOUNDRY,

1v1 San Francisco.

SALMON'S PROPELLOR AMALGAMATOR —AND— Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 J. & W. C. SALMON.

OIL WELL BORERS.

A CONTRACT WILL BE LET TO A RESPONSIBLE party to sink an Oil Well, as deep as may be required, on land belonging to the "Eel River Oil Company," situated in Humboldt county, Cal. For particulars, inquire at the office of the Company, No. 436 Jackson st., up stairs.

12v11-1m E. H. WILSON, Secretary

A Pearl Containing Gold.—We have now before us something new under the sun—a pearl in which are plainly to be seen three or four particles of pure native gold. The pearl is one found by Mr. George Eells, of this city, in a can of Baltimore oysters. The pearl is about the size of a common duck shot, and in shape is nearly round. There can be no doubt but that the pearl is a natural one, nor about the purity and genuineness of the particles of gold imbedded in it. Dozens examined it yesterday, and all were forced to acknowledge that the pearl was a real pearl, and that the gold was nothing else but gold. Two of the pieces of gold are so large as to be plainly visible to the naked eye, but the others can only be seen by the aid of a glass. These particles of gold would appear to have been the nucleus about which the pearl formed, and that so many pieces should have by some means got into one pearl would seem to be pretty good evidence that the sand about the beds from which these oysters are fished is wonderfully rich in gold. The specimen is something well worth preserving, as we are pretty sure that such another golden pearl has never been seen or heard of in any age or country. Instead of fishing for oysters, the Baltimorean oystermen had better go to scooping up the sand in which the bivalves are found.—*Territorial Enterprise.*

Deserved Testimonial..

Grizzly Flat, Oct. 18, 1865.

Messrs. Hungerford & Heney—*Gentlemen*: We have run your Concentrator for several days past, in our 5 stamp Mill, and, as far as can be ascertained at present, it is a perfect success. When running at the rate of from two hundred and ten to two hundred and twenty-five revolutions per minute, we have lost neither quicksilver nor sulphurets. Formerly, when using copperplate riffles and blankets, we found that in spite of the utmost precaution, quicksilver would escape over them all. Wishing you all success, we remain Your obedient servants,

E. A. BIGLER.
S. F. DAVIS.

AGENTS WANTED

—FOR—

The Secret Service, the Field, the Dungeon, and the Escape.

—BY—

ALBERT D. RICHARDSON,

N. Y. Tribune Correspondent.

1,000 COPIES SELLING PER DAY!

The most interesting and exciting book ever published, embracing Mr. Richardson's unparalleled experience for four years. Travelling through the South in the secret service of the "Tribune" at the outbreak of the war, with our armies and fleets, both East and West, during the first two years of the Rebellion; his thrilling capture; his confinement for twenty months in seven different rebel prisons; his escape, and almost miraculous journey by night of nearly 400 miles. It abounds in stirring events, and contain more of the fact, incident, and romance of the war, than any other work yet published. Horace Greeley says of it:

"A great many books will yet be written concerning this war, in addition to the many already in print; but not one of them will give, within a similar compass, a clearer, fuller, more readable account, entirely from personal observation, of the nature, animus, purposes, tendencies, and instrumentalities of the slaveholders' rebellion, than does the unpretending narrative of Mr. Richardson."

Teachers, ladies, energetic young men, and especially returned and disabled officers and soldiers, in want of profitable employment, will find it particularly adapted to their condition. Send for circulars. Address

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

The Golden Era is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the Golden Era are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by Pierce Egan, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "The Fair Lilias"; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Orgaulc Weakness, Debility, Female Complaints, Etc.

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

These suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect Helmbold's Concentrated Extract of Sarsaparilla. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

MINING SCHOOLS AT THE EAST.

The importance of mining schools appears to be rapidly gaining in public appreciation at the East. The school recently started under the auspices of Columbia College, at New York, met with a reasonable degree of success the first year. The session extends from the 15th of November to the 15th of May, and the course lasts three years. Part of the summer vacation must be spent in the field under the tutelage of the Professor of Metallurgy. The expenses of the student are $160 a year, and the cost of what he breaks in the laboratory. Forty-two students have entered and several of them passed their examination for the second year. Professor Charles L. Chandler has the chair of analytical chemistry and geology; Professor Thomas Egleston, of mineralogy and metallurgy; and Professor Francis Vinton of mining, engineering, and draining, thoroughly competent men, and supported by a corps of the Professors of Columbia College. The writer from whom these facts are condensed, says: The experience of a year has proved that their plans were sufficient to produce efficiency in their students, and with the better-enforced discipline of another year, the school will take rank with the military academy at West Point for efficient and thorough instruction.

The mining school at Harvard College has already commenced its first session. This school has been established in connection with the Lawrence Scientific School, and we presume the munificence of the friends of education in New England will not suffer the institution to languish for want of funds. A large amount of money has already been donated, sufficient to give it a fair start.

LAUNCH TO-DAY.—The California Steam Navigation Company's new steamer, which they have been building at the Potrero, will be launched at half past eleven o'clock A. M. today. This is the largest steamer ever built on this coast; her extreme length being 276 feet, breadth of beam 47 feet, and depth of hold ten feet five inches. She will be driven by a 600 horse power engine. The total cost of the boat, when finished, will be about $300,000. Her freight capacity is estimated to be one-half greater than that of the Chrysopolis, without drawing any more water than that boat. A steamer will leave the Third street wharf at 10½ o'clock, to take passengers out to the launch and back.

THE Humboldt *Journal* of October 26th gives a list of some twenty companies that are boring for oil in the various petroleum districts of that county. Some are down 250 feet, and are said to have "fine indications," but no flowing well is yet reported.

EARTHQUAKES vs. BRICK WALLS.

There appears, at the present time, to be a considerable feeling on the part of many in this community in favor of abolishing the Fire Limits Ordinance, in order that landholders may exercise their option with regard to building either of brick or wood. Of course, this feeling comes from those who feel a little nervous with regard to the safety of brick buildings in the event of another severe earthquake shock. The capacity of even indifferently constructed brick buildings to withstand pretty severe shocks, was quite conclusively shown on the 8th ult.; and a very safe inference may be drawn from the observations and results of that day, to the effect that brick buildings *can* be constructed which will be proof against even much severer shocks than any which we may reasonably expect ever to witness in California. The fact that many years ago (in 1812) a frail adobe structure—a large covered area constituting a church building—was thrown down by an earthquake, killing a large number of those assembled within its walls, coupled with the more recent occurrence of the partial fall of a single insecurely built structure, and the toppling over of a few fire-walls and chimneys, affords no valid reason why the people of this city should hesitate hereafter to build brick houses, or in any way interfere with our present very properly established fire limits.

It might be well, however, and indeed would seem to be the part of wisdom, that our city guardians should frame an ordinance which should, to some extent, regulate the character of the brick buildings which should hereafter be allowed to be put up anywhere within the city, either within or without the bounds of the "fire limits." We entertain no fear, whatever, that the earth, in these parts, will open and swallow us up, or that we shall ever experience an earthquake shock which will throw down a properly-constructed brick building, of moderate hight; but we do stand in daily fear of the tottering walls of sand and brick, almost innocent of lime, and the overhanging cornices and ornaments so plentifully seen in all parts of the city, and so carelessly put up, especially the latter, that they oftentimes become detached of their own weight, and come tumbling down on the heads of passers-by, to the great danger of life and limb. It is our humble opinion that the city authorities should lose no time in framing and promulgating an ordinance which should take cognizance of this matter, and prohibit in future all such departures from even the ordinary paths of safety, to say nothing about the extreme danger which always exists in countries liable at any time to earthquake shocks of a greater or less degree of violence. Wooden cornices only should be allowed, and those properly secured; chimneys, when placed on the edges of buildings, should also be properly stayed by iron rods, and tall fire-walls projecting far above the roofs should only be allowed when a competent and disinterested engineer or architect should pronounce them so stayed as to be as safe from overthrow as the main walls of the building.

HOW BRICK BUILDINGS MAY BE CONSTRUCTED EARTHQUAKE PROOF.

In the issue of this paper of January 7th, of the present year, we described and illustrated "Goodrich's Patent Hollow Brick Walls," showing by engravings the mode of their construction, their perfect protection against dampness (a serious evil with solid walls), and their great superiority, in point of strength and power of endurance against the effect of earthquake shocks. The cost of building walls after this plan is less than that of the ordinary wall, and their construction is perfectly simple and practicable. The following is the inventor's description of their construction for an ordinary building of two or three stories in hight, with walls say twelve inches thick:

"The foundation walls, if of the ordinary hight, I would lay up in the usual style, solid to the hight of the underside of the first tier of floor-beams, tying them in the usual way, or as hereafter described for the hollow walls. From this last named level (the under side of first tier of floor beams,) I build two four inch (half brick) walls, separated by an air space or chamber of four inches along the center of the wall. All the bricks being laid as stretchers, with a full and perfect bond with each other up to the next tier of floor beams, introducing in the mortar joints at every third, fourth, or fifth course, or as often as may be thought best, as ties, strips of wood, or pieces of hoop iron, to tie the four inch walls together, to prevent them from separating or collapsing, and for otherwise strengthening the walls, and for other reasons hereinafter set forth. These strips I lay diagonally across from one four-inch wall to the other, as shown by engraving, at an angle say of 45 degrees, or at a greater or less angle with the surface of the wall, as one may think best. In a building I have lately built, I introduced them in the following plan: I placed them in every fifth joint of mortar along on the wall, about a foot or ten inches apart, measuring parallel with and along the wall, and at angle with the face of the wall of about 45 degrees, laid upon the naked bricks, their ends extending near the inner and outer faces of the wall, and were buried in, and overlaid by the following joint of mortar and layer of bricks. The next course of ties, or braces of wood, are laid at the same angle to the face of the wall, but in the *opposite direction* from the preceding ties, and this rule I observe throughout the wall, the ties constantly alternating, appearing, when looking down the hollow space along the center of the wall, like lattice or herring-bone bridging between floor timbers, and giving the same character of support to the walls that such bridging does to floor beams, in addition to their tying the walls in every other direction.

Opposite, and at the end of every set of floor beams, above the foundation beams, and entirely about the buildings, I build the wall solid the depth of the beams, excepting what is necessary for ventilation; as no dampness can penetrate, or do harm at this point, as the wall-plates would prevent all dampness going to the walls below it. This solid brick-work, of four or five courses, which it naturally would be, gives every facility necessary for anchoring the floor-beams to the exterior walls, and also distributes more equally the weight of the floor, roof, etc., over both the inside and outside walls, and makes both the inside and outside walls alike support the superstructure.

The wooden ties I have thus far made use of were made from the common four feet sawed plasterer's laths, the usual width and thickness—about one and one half inch wide by full a quarter of an inch thick.

For walls, for carrying great weights or of great hight, I would increase the inner or outer wall to a single brick wall (8-inch wall), or build three 4-inch walls (half brick walls), with two air spaces of any desired width, and let the laths or ties run diagonally across the three courses, with an 8-inch wall. Either of the last mentioned modes would answer for any place where a solid wall of the same thickness would answer.

I have also, under the same patent, another method of tying for hollow walls, which consists of a large continuous wire about the size of that used for telegraphing. This I run zig-zag from one wall to the other, lapping on each wall some three or four inches, and continuing about the building, or from opening to opening. It makes a good tie, and is valuable in many places."

Mr. Goodrich, the patentee of the above invention, is an old resident of San Jose, and his skill as an architect and builder is well supported by many of the finest structures in Santa Clara county, and the stability and superiority of his mode of constructing brick walls is attested by nearly all the county officials and leading business men of that county.

From a personal inspection, by one of the proprietors of this paper, of several buildings put up by him, we are enabled to state that those buildings were not damaged in the slightest particular by the late severe earthquake, and we are furthermore assured that the same immunity from damage is equally observable in all which he has put up. A careful examination of the principles on which these walls are built, must convince any one that where they are properly secured by ties to each other, and to the flooring and partitions, they must stand unharmed through an earthquake shock, where walls built in the ordinary manner would be reduced to mere heaps of rubbish. We look upon this invention as one of great utility, and would suggest that its merits should be carefully and thoroughly examined by our mechanical readers.

If some such plan of building as the above could be adopted, we feel quite sure that it would add greatly to the general security of life and property in this city; to say nothing of the load of anxiety it would remove from the minds of such as are more especially sensitive to these peculiar dangers, of the existence of which we are so frequently reminded in a manner which not even a philosopher can witness without some indication of nervous uneasiness.

A NEW BUSINESS FIRM.—We notice that our old friends, W. A. Holcomb and Capt. J. E. Ager, have associated themselves together under the firm of W. A. Holcomb & Co., to do a general warehouse and commission business in this city. They have established themselves at the southwest corner of Battery and Vallejo streets, where they are prepared to attend to any business in their line. Both these gentlemen are well known to business men throughout this State and Nevada. Mr. Holcomb was for a long time Treasurer of the county of Humboldt, in the State of Nevada, and is well known as an active business man, in every way worthy the confidence and patronage of the public. Capt. Ager was well known for many years, as Superintendent of the old and popular Langton's Pioneer Express Company, in which capacity he won for himself the confidence and respect of all with whom he came in contact.

COPPER ORE SHIPMENTS.—The total shipment of ore from the Union mill for the week ending October 26th, was 776½ tons, which will produce nearly or quite 200 tons of pure copper.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

The Problem of Gold and Silver Extraction--A General Review---No. XVII.

BY PROF. L. LANSZWEERT.

THE USE OF COPPER AMALGAM.

The expenses attending the patio process are generally very high, even when the reduction works are most favorably located, and the minerals of an easy nature for working. One of the principle causes of this is the loss of quicksilver; which is generally heavier in weight than the total amount of bullion obtained. Immense quantities of poorer ores than those hitherto tested could be reduced, if it was possible to extract the silver with little loss of quicksilver. In studying the chemical reactions which take place in the *tortas*, it is to be seen that several of these reactions could be produced by other metals than quicksilver, viz: by zinc, tin, lead, and copper.

Experiments with copper amalgam, made in several reduction works in Mexico and Chili, have given good results for a certain character of ores at Guadalupe and Callao. The substitution of copper amalgam for mercury not only alone reduces, considerably, the time of amalgamation, but gives a larger percentage of silver, and a less consumption of mercury. The use of copper amalgam has also lately proven itself a success in Washoe, where it has been introduced in some of the mills by William R. Frink, of Virginia City, to whom letters patent of the United States, dated August 13th, 1865, have been issued, which claim "the use of finely pulverized or precipitated metallic copper, in combination with or without the sulphate of iron, or other material used in precipitating, for the purpose of facilitating the process of amalgamating silver with the least possible loss of quicksilver." We here find at least one sensible Washoe patent process. As the patentee is himself a practical worker, there is little doubt that this system will be generally adopted when more universally known. Considering, separately for the present, the reaction of the reduction of ores containing specially chloride of silver and those containing sulphides, we find that in the ordinary process of amalgamation, the quicksilver exerts two different actions; the first is the transformation of the salts of the magistral, the production of soluble reductives necessary for the precipitation of silver; the second is the formation of an amalgam susceptible of being readily dissolved in an excess of quicksilver. The first of these two actions is the principal and inevitable course of the loss of quicksilver; the second, per contrary, exposes it only at a nominal loss, when the operation is conducted with proper care.

For the first action, quicksilver may be advantageously replaced by metallic copper, the action of which, on the salts of the magistral, is stronger; for the second action, no metal can replace the quicksilver; therefore, to economize quicksilver in amalgamation, it is necessary to obtain the entire transformation of the salts of magistral, by the addition of metallic copper, and still to have quicksilver enough, in excess to dissolve the formed amalgam. The metal, therefore, which is to replace the quicksilver as reducing agent, must be in a very finely divided or minute state; without that, its action would be very tedious and incomplete. The simplest process to obtain the copper thus divided, is to combine it with mercury, and thus make a liquid amalgam easily disseminated through the mass.

The salts and magistral is first applied to the ore, half an hour before the incorporation of the copper amalgam; the reaction in pans generally takes place in from four to six hours, depending on the time occupied by the solution of copper in reducing, to their minimum, the salts of iron and copper, and freeing the silver, which then amalgamates these with the quicksilver.

The action of the metallic copper on the salts of the magistral is generally so rapid that the results of the operation depend on the dissolution of the chloride of silver. The process is greatly facilitated by using a magistral slightly acid; the sulphate of copper, obtained from the reduction works, is preferable to the sulphate obtained of copper pyrites roasted in reverberatory furnaces.

The proportion of copper to be used is that necessary to produce the reductives—that is to say, a little more of one equivalent of copper for each equivalent of silver to be precipitated. It requires a little more than an equivalent, because the chloride of silver is decomposed only by a certain excess of reducing salts. An excess of copper must be avoided, as so much of the metal as is not dissolved amalgamates with the quicksilver, and is consequently obtained with the silver, after the distillation of the quicksilver.

According to these theoretical considerations, the operation may be done in a short time. The precipitation of the silver must be complete, if the proportion of magistral is in sufficient quantity to produce the complete dissolution of the chloride of silver. When that is properly accomplished, the loss of quicksilver by dissolution is merely nominal, and the amalgam of silver contains only traces of copper.

It seems rational not to introduce, at once, the whole amount of copper amalgam; but rather proceed, by successive incorporations or additions, as thereby a finer bullion, without copper, is obtained. The amalgamators can easily ascertain the progress of the operation, the diminution of the quantity of copper amalgam, and, by trials, would soon learn the favorable moment to add a new proportion of the metallic reaction. As it is very difficult to know the exact amount of chlorides of silver in a quantity of ore, consequently it is difficult to calculate exactly the amount of copper amalgam to use. In adding, at once, the whole amount of metallic copper, there is danger of employing too much or too little copper, by which the operator may obtain coppery silver, or lose more mercury than by proceeding by successive incorporations.

Further information with regard to this process may be obtained, by letter, from the patentee, now at Virginia City, Nevada.

SULPHIDE OF SILVER.

In the reduction of ores containing sulphides of silver, the soluble reductive salts necessary for the precipitation of silver, are produced largely by the action of the salts of the magistral on the simple or complex metallic sulphides. The principal cause of loss of quicksilver is the sulphuration of the metal, produced by the elimination of sulphur in the dissolution of the metals. The loss must be limited by the operation before the complete decomposition of these combinations in which the silver is engaged. In using the copper amalgam, part of the sulphuration of the mercury is avoided, and the dissolution of this metal is stopped through the influence of the salts of the magistral. A large proportion of magistral can be used, and consequently richer ore can be operated upon, losing less quicksilver than by the ordinary way—the advantage resulting in the substitution of copper amalgam to quicksilver is very important, although the results expected are not so favorable as with silver ores containing chlorides. The affinity of copper for sulphur is greater than those of the other metals.

[Written for the Mining and Scientific Press.]

The Silver Peak Mining District.

The Silver Peak mining district, situated in the southern termination of the Toiyabe Mountains, distant from Austin 150 miles, and from Aurora about 70, is now attracting much attention, from the fact that some of the largest, and, at the same time, equally as rich ledges have been discovered there as any yet found. The ledges generally run from eight to thirty feet in thickness of vein, and, notwithstanding their vast extent, assay and work as high as from $150 to $700 per ton.

The first locations made in the district were those of the Vanderbilt, Pocotillo, Astor, South America, and some ten others. These locations belong to the Great Salt Basin Mill and Mining company. Those of the companies' mines in the most advanced stage of development are the Vanderbilt and Pocotillo. The former is admitted to be one of the most valuable mines yet discovered. The locators gave one-half of the mine to Mr. Sam. Martin, in exchange for a 10-stamp mill, erected there by that gentleman. The mill is now in most excellent running order, and reducing daily from 10 to 15 tons of ore, which is yielding about $250 per ton by wet crushing.

Another really valuable group of ledges in this district is that of the Upton & Harker company, and known as the Cardwell, Minnappolis, Reindeer, Eagle, Belvidere, with some seven others—all on what is known as the Rothschilds' ledge. The company have in connection with their mines 360 acres of salt land, with the purest quality of salt, several feet in thickness, lying all over it, also an inexhaustible supply of wood and water.

Some of the ore from these ledges has been worked in Aurora, by mill process, yielding as high as $207 in silver and $188 in gold per ton. This result was from the Cardwell mine, a ledge fully twelve feet in thickness. Another working of these ores was from the Reindeer, yielding $220 in silver and $42 in gold per ton. The so-called Rothschild ledge, on which these locations are made, crops out for fully one and a half miles, and in some places the outcrop stands several feet above the surface. This property has been sent East for sale, and is in the hands of M. Upton, merchant, of Carson, Nev., who went to New York in September last.

THE NEW YORK AND SILVER PEAK MINING COMPANY

Is another of the leading enterprises of that remarkable mineral region. This organization stands second to none in the district; it being gotten up by some of the leading pioneers of the county, who were first on the ground, and at its discovery secured to themselves some of the very best ledges, as well as other desirable privileges, such as salt marsh, wood, and water. The mines of this company are the Silver Chamber, New York, John Grimes, and some five others. The ores from these ledges, respectively, have assayed $695.50, $707.44, and $1,166.16 per ton, in gold and silver, the latter predominating. These locations were made by Harvey A. Mills, John Grimes, W. C. Marly, and C. D. Spires. These gentlemen having several other locations in the district equally as good as those mentioned, sent these mines on to New York by Mr. A. L. R. Hallowell, who returned from there in September last, bringing with him the proceeds of the sale of these mines amounting to $190,000. The company who purchased these ledges have a 40-stamp mill on the way to their mines. Its arrival is daily looked for.

Mr. Hallowell, after disbursing his charge to the fortunate owners, and taking not more than sufficient time for the acceptance of a magnificent gold-headed cane, manufactured from the real native mountain mahogany, and put up in J. W. Tucker's (of San Francisco) best style, which was presented to him by his many warm friends in Austin, has again set out for the East. Mr. Hallowell takes with him this time some of the first locations made in the district by the same set of pioneers, who, having it all their own way, made sure of the best there was.

The number of locations sent on this time by this committee is nineteen, foremost amongst which are the Shakspeare, Maulden, Maggee, Tyrone, Utica, and Albany, assays from the ore of these ledges ranging from $200 to $1,000 per ton, and carrying gold for about one quarter of its value. The writer having examined several lots of the ore from these ledges, found them to be very excellent ores of the sulphuret class, combining slightly with iron and copper, but to a much greater extent with antimony and arsenic—little or no lead whatever appearing in the combination. All the ores examined were from depths varying from fifteen to fifty feet.

One rather peculiar feature in the mines of Silver Peak district, is that even to the very out-crop the sulphuret ores prevail, though they show considerable of the chloride and native silver in the interstices of the vein matter; the gold appearing in its native state directly in the silver sulphuret as well as in the quartz. There are two of these ledges intersected by a deep gorge or canon, on each side of which the mineral vein lies exposed for over 200 feet, whence ore enough can be taken, by merely running a tunnel on the vein, to supply a 20-stamp mill for three years from the level thus attained to the out-crop at the surface, without taking into account what may be found at a lower depth. These ledges run parallel to the Vanderbilt, at a direct distance from a half to one and a half miles. In connection with these mines the company have secured an a undance of wood, water, and salt; of the latter there is a never-ending supply. Silver Peak district seems to be ahead of any one district yet discovered in this State; at least such is the expressed opinion of all who have had an opportunity of judging from personal observation.

The writer has seen several letters from parties East to their correspondents here, to purchase for them mines in that district, and others requesting their agents to send on Silver Peak mines in preference to any other to be sold.

There is a line of stages about being started from Austin to the Peak, touching on their way at many of the best districts in the country, namely—Ione, Twin River, San Antonio, Red Mountain, and others on the way where much prospecting is now being done. Scarce a week passes but new discoveries are made, and new districts formed in the southern and middle portion of this State, and from the samples of ore brought in, they must generally be acknowledged to be rich. J. R. M.

[Written for the Mining and Scientific Press.]

A Self-Operating Water Reservoir.

Messrs. Editors:—In my travels through the State, I recently saw in Trinity county a new mode of applying water in ground-sluicing, which I think would be very beneficial to miners in some localities, if understood and practiced, especially where ground is poor and water scarce; and believing your paper to be a true friend of the miner, and the best medium of conveying information on such subjects, I send you a description of it.

This mode of applying water is by what is called a self-operating reservoir, which may be used with any quantity of water; the principal point being to make a small stream accomplish greater results than by any other mode yet practiced. One great advantage is, that one of these reservoirs can be built on any side hill. It is not designed to reserve water but to make an application of it.

For the better understanding of this mode of ground-sluicing, I will suppose a man has a piece of ground which is too poor to pick and shovel into sluices, and to attempt to ground-sluice it with a small head of water would be of no use; but let him build one of these self-operating reservoirs, and he will make good wages from the ground with his small head of water.

The construction and washing of this sluice may be described as follows: Take a box that will let out one hundred inches or more of water, lay it down in its place and throw up your bank, for the reservoir, which must be quite small, one that will empty in two minutes being most useful. Now take a piece of canvas, the exact size of the aperture in the end of the box, and nail strips of boards across it, the bottom strip being the widest, with a staple in the center; let the strips be one inch apart, and each strip narrower than the other, until a complete gate is made; then nail this gate securely to the upper end of the box, so that it will fall easily upon the end of the box, completely covering the aperture, and thus form a tight gate. Now take a pole a little longer than the box, and lay it parallel with it, and across the bank of the reservoir; notch the pole in the middle, and lay it on a round block in the centre of the bank, so that it may swing easy, like a well-pole. Now take a small rope and tie one end of it to the staple in the bottom strip of the gate, and the other end to the end of the pole, over and a little in advance of the gate. Then take a box, say three feet square and one foot deep, in the bottom of which bore an auger hole, and hang the box with cords or wire to the end of the pole. It will be necessary now to make the end of the pole which is over the reservoir heavier than the end with the empty box. Then cut a trench across the bank of the reservoir, parallel with the pole, about one foot deep, and put in this a common sluice-box, so that the water in the reservoir, when full, may run through it, into the box, at the end of the pole; the weight of the box, when full of water, will be greater than the weight at the other end of the pole, and descending, raise the other end of the pole, thus opening the gate.

The box, when full of water, must not be allowed to descend so low as to tear off the gate, but must rest upon a place prepared for it. The auger-hole at the bottom of the box must be of such size that all the water may run out of the box at the same time the water runs out of the reservoir, so that both will be empty at the same moment of time. Then the weight of the end of the pole over the reservoir being the heaviest, will descend, and the gate will shut, and thus the reservoir will fill and empty itself without the aid or care of the miner, who may be at work a mile away.

The beauty and profit of this mode of ground-sluicing is two fold. It makes available a small stream of water, and gives the miner a chance to remove all large rocks while the reservoir is filling, and will answer in many places a better purpose than a hydraulic, and a man ever so poor may avail himself of its use, and make wages from ground that would not pay in any other mode of working.

If the publication of the above will benefit any poor miner, the writer will be well satisfied. B.

Mining Summary.

The rain of Sunday night last foreshadows an early and abundant supply of pluvial favors, and a proportional in-gathering of a golden harvest. We learn from our exchanges that it was much more abundant in the interior than upon the coast. Along the banks of the Sierras, a short distance above the foot-hills, the ground was, for a short time, whitened with snow; while in some localities lower down the storm was attended with very remarkable electrical displays. We continue to gather from our exchanges abundant evidences that the most gratifying success is attending the labors and expenditures of our enterprising miners.

CALIFORNIA.

Trinity County.—We learn from the Trinity *Journal* that active preparations are being made for the approaching rainy season. At Hay Fork unusual activity prevails. Francis & Burke are pushing their ditch to completion with all possible activity. When finished, it will open rich diggings for a large number of men. Mr. Francis mentioned having taken $700 from one of his claims in a single week. Miners are gathering in on the lower river, there being some 40 or 50 in the vicinity of Cedar Flat already. The population of the county is increasing, and the signs generally cheering.

Plumas.—We find the following in the Quincy *Union*: "All the quartz mills, excepting the Buckeye, at Round Valley and Greenville are running, and making good returns."

Messrs. Trucks & Waterworth are at work removing the Buckeye mill to a place near their ledge, below Greenville. They intend having it in running order again during the next month.

The Crescent Company made the first clean-up from their new mill on Sunday last. It was much larger than they expected, as they had been running on a poor quality of rock. The amount taken out for the week's run was about $10,000.

Yuba.—The Blue Gravel Mining company, near Smartsville, says the Marysville *Appeal*, cleaned up, last week, the boxes at the head of their flume, after 30 days' run, taking out $26,600, being the largest amount, by some $2,000, ever taken out on so short a run. This is the seventh clean-up they have made since January 1, 1865. The gross amount taken out since that time has been about $240,000.

Nevada.—We learn from the *Gazette* that the Union company's incline has been sunk thirty feet below the old workings, and that the ledge is improving in character and thickness. Sixty tons of rock have been taken out. The French mill is crushing rock for various companies in the Summit district. The *Gazette* of the 25th ult., says that mill commenced the day before crushing a lot of four tons of rock from Last Chance ledge. Another lot from the Pacific ledge was then being hauled to the same mill. One load came through town the day before, and more is on the way—the whole lot amounting to twelve or fifteen tons. According to the *Transcript*, four tons from the Pacific paid $53.50 to the ton. The *Transcript* also says that twenty tons of rock from the Prosper lead lately worked at the French mill paid at the rate of $23.15 to the ton. This lead is located near Little Deer Creek, and as it costs the company only six dollars to work it, they have a good thing.

The well-known Burdett mine, which has recently passed into the hands of Eastern capitalists, according to the Grass Valley *National*, is beginning to "pan-out" well. The company has struck a wide ledge showing much free gold.

The *Union* says that the Empire company have struck another handsome ledge in their new incline, located about one hundred feet north of the mill. The ledge was struck on the 26th ult., and is very rich in sulphurets. The size or value of this ledge will be immediately tested.

The Gold Hill mill is crushing about 120 tons of rock per week, and a few days since had five tons of rock from the Enterprise lead, Summit City, at the mill.

Placer.—The evidences of the existence of silver in this county appear to be constantly accumulating. Mr. J. Campbell, an engineer on the Pacific railroad, has shown the editor of the Sacramento *Union* samples of rich silver ore obtained in Placer county. He informs that paper that, on the 28th ult., a silver lead was struck about two miles northwest of Newcastle, and that about 4,000 feet of the lead have been taken up. Samples of the rock taken from near the surface have been assayed by Waters & Co., of Sacramento, with the following result: Gold, $69.24 to the ton; silver, $191.62; total yield per ton, $260.86. Workmen are engaged in sinking a shaft on the ledge. If rock of this character can be found in considerable quantity, times will become lively in that region of Placer. A specimen of the ore which has been roasted shows an abundance of silver in globules on the surface.

El Dorado.—Speaking of the copper interest in El Dorado, the Folsom *Telegraph* says that the arrival of several vessels at New York city, loaded with copper ore from California, has awakened Eastern capitalists to the growing importance of the copper mines of this State. A number of companies that had suspended operations in this and adjoining counties, that no doubt have good claims, are again about to commence work, and several agents from the East have lately been examining the country about Folsom, for the purpose of investing their money. With a change in the financial policy of the State, Eastern men may be induced to invest their money in this State liberally.

Calaveras.—The attention of miners in this county, says the Calaveras *Chronicle*, has been turned of late to quartz mining, and we hear daily of new leads being discovered and old ones opened. Capitalists from New York, and throughout this State, are now visiting our mines with the intention of purchasing lodes and erecting machinery. In the vicinity of West Point several mills are now in operation. New mills will be built next spring at Mosquito and Rich Gulch. A mill will be put up this fall, on a lead of known richness, within two miles of Mokelumne Hill. A mill is now in running order near the Bay State Ranch, some two miles from San Andreas. Before another year expires, Calaveras with take a high rank among quartz-producing counties.

According to the Copperopolis *Courier*, the Union mine, for the week ending October 26th, shipped 776 tons. On the 25th of October the Table Mountain Company shipped from their mine 7½ tons of first-class copper ore.

Tuolumne.—The Sonora *Herald* says, "What we have so long lacked is coming to us, viz., capital to help to develop what we confidently believe to be the richest quartz leads within the limits of the State. We hear of transfers being made almost daily—not promises to pay, but for cash in hand to the seller. And what is more cheering still, arrangements are being made to put up several new quartz mills of superior capacity."

Amador.—The *Ledger* says that Boyle & Co., of the Sutter Creek Mill, near Volcano have sold out to Fogus & Co. of Sacramento The new proprietors will make various improvements.

Ward & Co., of the Golden Eagle mine, near Volcano, are erecting a fine 12-stamp steam mill.

Trenchel, Wetzlar & Co., of the Jackson Pioneer quartz mine, near Jackson, have "struck it rich." Very rich rock is also being taken from the Kennedy mine.

Tulare.—The Grass Valley *National* learns from G. D. Roberts, who recently returned from Kern River, that the mines in the Clear Creek and Long Tom districts are being developed to a depth of from one hundred to two hundred feet deep, showing a continuity of good paying ore at that depth. Mr. Roberts thinks these mines will soon be famous, as there is no longer a doubt of their great value. The Long Tom mine, owned by Messrs. Roberts & Co., is from five to seven feet thick, and the ore, as tested in arastrus, pays from eighty to one hundred dollars per ton. They are now erecting a 10-stamp mill, which will be completed by the first of January. Mr. Boston, of Grass Valley, one of the most skillful and experienced machinists of this State, has been employed to superintend the construction of the mill.

VIRGINIA CITY AND VICINITY.

The matter of draining the Comstock lode to the greatest possible depth is now being urged, with much vigor, upon the attention of stockholders interested in claims upon that lode, and the parties interested appear to look with much more favor than heretofore upon the project. The following paper has been circulated for signatures, and has already been signed by many of those most heavily interested:

"The undersigned, Presidents, Trustees, and Stockholders of mining companies on the Comstock ledge, hereby recommend the speedy adoption by all those companies of the contract offered to them by the Sutro Tunnel Company, which contract, in our opinion, presents the best plan for accomplishing the great and absolutely necessary labor of draining the lode to a good depth, besides furnishing the best means of ventilation, and the cheapest mode of extracting the ore."

We have received a copy of the contract offered by the Tunnel company to the stockholders, for the purpose of calling their special attention to the matter at their approaching annual meeting.

The yield of the mines about Virginia City and Gold Hill continues quite up to the average for several months past. The estimate for the Gould & Curry is about the same as that of last month. There is said to be a vein of ore in the west end, about the D street tunnel, 400 feet long, and 200 deep, and there is room for a great amount of ore. A couple of months ago the superintendent thought there was little prospect of getting anything in that place, but now he entertains much hope of it. The mill is reducing about 100 tons per day.

The Savage is yielding about 150 tons per day, worth $43 or thereabouts per ton. The appearance of the mine continues favorable.

The Chollar-Potosi has given notice that the stock of the consolidated company is ready for delivery to those persons who produce certificates from the proper Secretary that they hold stock of either Chollar or Potosi, clear of encumbrance or assessment.

During the week ending October 16th, 41 tons first-class and 1,306 tons second-class ores were extracted from the Yellow Jacket mine. During the same period 930 tons second-class ores were reduced—yielding $33,303.42, or an average of $35.78 per ton.

The Imperial mine, it is said upon reliable authority, is looking fully as well as ever, and that the yield for October shows a considerable increase over the two previous months. A large reserve of ore is being accumulated to provide for the contingencies of winter The receipts of bullion from this mine during the month of October were $110,000.

The hoisting works of the Daney have been shut down for a time for the reason that the company are about to commence cutting a drain tunnel several hundred feet in length to tap their mine at a depth far below the present working level.

The Dayton mills have commenced crushing ore from their mine in Gold Hill, which is yielding a large supply of exceedingly rich rock.

ESMERALDA.

The Esmeralda *Union* says that the Blind Springs district is still attracting considerable attention and capital, and if the production of rich ore and bullion are any indication of a good mining camp, we shall certainly have to pronounce it good. Mr. Williams, one of the proprietors of the Diana ledge, has shown the editor of the *Union* eight bars of bullion, weighing 130 pounds, which were extracted from about eight tons of their third class ore. They are shipping their first and second-class ore, as they can get more advance upon it than they would be likely to get out themselves. The above bullion is the proceeds of a two-weeks' run of a small mill, requiring four men's labor, and propelled by water-power.

The same paper learns from Mr. Pope, the superintendent of the Wide West, that the shaft has attained 320 feet from the surface. He also states that the company are in good cheer, and is bound to see if there is not something in store for them.

The Citizens' Prospecting shaft has attained a depth of 275 feet from the surface, and is being pushed forward with energy.

Copper Shipments.—The *Prices Current* of this city says that our shipments of copper ore continue to be liberal—far in excess of any previous year. Upwards of 16,000 tons have been sent this year from the interior for exportation to the Atlantic and elsewhere—giving employment to numerous vessels destined to New York, Boston and Swansea; yet the export of this article is but in its infancy. The copper ore interest of the coast promises to be more valuable and important than that of our quicksilver mines. Of the former, the world's consumption will probably keep pace with the increased supply, while of quicksilver the demand is restricted, and the markets open to us are easily supplied, and it requires good management on the part of producers to regulate shipments so as to keep prices as uniform as possible. It is true, that our exports thus far during the year show a slight increase over those of 1864. But it is the policy of the New Almaden Company to keep their exports of quicksilver so distributed as to prevent any material fluctuation in value.

The Golden Gate Treasure.—The pilot boat Petrel, in charge of T. J. L. Smiley, started on Monday last for Manzanillo, from which place they are to proceed to the spot where the mail steamship Golden Gate was wrecked, for the purpose of recovering, if possible, the remaining portion of the treasure sunken in that vessel. The amount submerged is between two hundred and fifty and three hundred thousand dollars.

The Etna Company's Mill.

One of the institutions of the county, and one engaging a large share of attention from the community, is the establishment, known as Stevenson's Mill—just completed, for the Etna company. The company has a ledge in Prince Royal which yields fine ore. Two or three tons of the ore, sacked, stand at the mill, ready for the stamps. Stevenson, finding that the ledge would not yield pay ore in such quantities as would keep the mill constantly employed, and finding opportunity to make good terms for a wider ledge, arranged for a section of the Montana, and procured a mill-site at a point on the river convenient for working ores from the districts now yielding the largest supplies.

He procured the services of an engineer highly recommended by San Francisco machinists, Morgan Hungerford, and gave him carte blanche for a run of the San Francisco foundries—with instructions to get up the best ten-stamp quartz mill and steam engine that the foundries could turn out. Judging by the appearance of the machinery at work, and by the unanimous verdict of those who undertake to be judges of such matters, Hungerford has come up fully to Stevenson's requirements. We have heard no one suggest an improvement in any part. After getting the castings out, Hungerford has had entire superintendence in putting the parts in place—planned the building, the masonry, and superintended the carpenter and other work. The McBeth boys, well known as accomplished workmen, did the mason work, and are now building a stone dwelling for Stevenson.

The mill is driven by a forty-horse power engine, with 12-inch cylinder of 24-inch stroke. The boiler is 44 inches by 16 feet—44 three-inch flues. The furnace has several new features, passing the flame three times throughout the length of the flues, thus avoiding waste of heat. The steam chamber is supplied with a cut off, by which the steam can be compressed so as to work with little or great sweep, as may be desired.

The reduction works consist of a ten-stamp battery, with all late improvements in guiders and cams; excellent arrangements for feeding and discharge; four of Varney's pans, and two of Varney's large settlers; then to capture and detain such particles as might escape the pans, two of Prater's concentrators have been introduced, through which all the tailings pass. These latter are a feature we have not seen in any other mill. They go with a jerk and back jerk, somewhat in the style of a pan in the hands of a gold miner. The particles saved by the concentrators will be kept for roasting.

The arrangement of the gearing is the best we have ever seen. A man can go erect throughout the entire length of the shaft which drives the battery, the pans, the settlers, and the concentrators. Can be free from all danger of accidents while oiling or otherwise attending the machinery, while in motion. Another convenient arrangement is levers, extending up through the platform which covers the shaft, by working which the miller starts or stops any single pan, settler, or concentrator, at will, with a very light tax of muscle.

A 4-inch pump, discharges the same as the draft, thus obviating friction, is worked by the engine, and supplies water to a large cistern, from which it is carried to the boiler, and in iron pipes to all parts of the mill. Steam is carried in like manner from the boiler to the pans and settlers.

All these works are covered by a fine frame building, 51 by 54 feet, on the ground; the building sitting on a succession of benches in the bank, cut out to suit the several levels wanted for the successive processes through which the ore goes down. From an upper-side view, the mill is an unpretentious establishment—just high enough above the bank to get shed for the feed floor and battery. From the Arabia side it looms to a three-story building. Stevenson has excercised good judgment, and the whole work is a standing testimony to the ability of Mr. Hungerford, the accomplished engineer. Everything is in order, and the battery will be put in motion next Monday. *Humboldt Register.*

Decline of Nantucket.—A letter from Nantucket says: "The grass grows in the middle of streets that once echoed to the busy feet of trade. Vast edifices—sperm candle manufactories, oil cellars, ship chandlers' stores—are abandoned to the mercy of the elements. Whole blocks and rows of buildings are deserted. It seems as if the soul that once tenanted it had taken its flight, leaving only a poor mockery of life behind it. Its population has dwindled down to one-half its former number. Nearly all its young men seek their fortunes in more promising fields of enterprise."

H. W. Waite, of Grass Valley, is about to commence the publication of a daily paper at Colfax, Placer county.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 4th, 1865.

A more active demand prevails for moncy in Bank and upon the street, but the requirement is not yet of sufficient urgency to materially affect current rates of interest for acceptable securities, nr to impede the negotiatione nf parties in good credit. Without any appearance of stringency, there is an evident tendency to a higher rauge of quotations for money. The deposits iu the different banking institutions of this city do not probably exceed $5,000,000 at this time, as against $8,000,000 in available cash means on hand August 1st, and the amount under discount now is said to be larger than it has been for months past.

The aggregate receipts of Treasurc, from all sources, during the month of October, amounted to $4,250,000, and since the first iustant some $500,000 has been received.

A good demand is likely to prevail for hullion in a day or two, but the rates thus far have showu little or uo variation from last week, and gold bars are selling at 850@860 for average grades. Silver may be be quoted at par to ¼ ℘ cent premium.

The mining share market has exhibited little or no vitality this week. Transactious at the Board have been much lighter than usual, and were chiefly coufined to a few leading stocks, in which operations have been made from day to day without much regard to the character of advices from Nevada. The aggregate yield of all the mines on the Cometock, including Gold Hill proper, proves, during the past month, to be larger than was anticipated, and exceeded $1,075,000. There is likely to he a larger bullion product thie month, from all that we can learn, and a number of claims hitherto heavily in debt will probably soon be in a condition to cancel a very considerable portion of their liabilities. Expenditures have been made without etint during the past three or four months, not only for timber, supplies, etc., for tbe winter, but in the development of new bodies of ore, for the purchase of mills and machinery of all kinds, in sinking new and expensive shafts, etc., etc. Notwithstandiug all tbese extraordinary disbursemente, tbe aggregate debt of the leading claims dealt in at the Board is less than it was in June last, without regard to the asseessmente paid since then. With scarce an exception all ore-producing mines have of late been making some money over and above ordinary expenses, and now that their extraordinary expenditures are to be materially less than for some time past, we may confidcutly expect their affairs to assume a better shape at no distant day. As to the quantity of ore disclosed at this time, in the lower levels of leading miues, some contend that it will compare favorably with any former period since May last; while others maintain that there is now lese ore in sight than thcre has been for months past.

Alpha met with trifling sales at $925, aud is now offered at $900, buycr 30. Advices from this claim speak of some improvement in the lower level, from which portion of the mine good ore can soon be taken. Gould & Curry rose from $975 to $1,025, and then sold at $1,000, closing at $1,050 asked.

Yellow Jacket has shown rather more eteadiness, without any improvement, however, advanciug from $760 to $825, buyer 30, then selling at $742½, and closing at $740. During the week ending October 23d, 10½ tons first class aud 1,334 tons secoud clase ores were extracted from tbe miue. In the eame period 1,334 tons second class ores were reduced (879 tons at outside mills and 455 tons at the company's mill), yielding in the aggregate $37,701, or an average of $28.25 per ton from partial returns. An accident last week to the steam power of the Morgan mill has sinco then reduced its crushing capacity from 90 to 30 tons per day, but the necessary repairs will be completed in a few days.

Savage has been less active, and 20 feet were sold within a range of $775@825, closing at $802½. Receipts of bullion last month amounted to $137,000—an increase of $40,500 over the month of September, and the financial affairs of this company will probably soon ehow a material improvement. In the fifth level a width of 35 feet bae been breaeted out. The east corner contains a very rich streak of ore, and the west end also looks well. Throughout the drift 40 feet acroes the Potosi chimney the ore ie thought to compare favorably with tbe body breasted out. Late crushings of ore from tbis mine average about $39 per tou.

Crown Point has been very inactive and dull at $800@725, closing at $710 bid. At a depth of 20 feet below the 230-feet level, the west stratum is turning out eome good ore, and above the 160-feet level, in drifting south a ledge of fair cre 3 feet iu width has been disclosed.

Belcher rose from $480 to $550, receded to $470, and sold yesterday at $450.

Ophir continues to be well maintained, in view of the decliue in other stocks, and 100 feet were dealt in, advancing from $385 to $425, receding to $412½, rallying to $425, aud closing yesterday at $380. From the 15th to the 29th of October, 970 tons of ore were sent to the Woodworth mill, which will yield somc $28,000 net; and during the same period 108 tons, worth about $10,000, were delivered at tbe Washoe mill, nearly all of which was taken from the fourth gallery of the south miue. Owing to an accident to the Woodworth mill, receipte of bullion were light last montb, and amounted to less than $20,000. The eouth drift from the Mexican shaft, in the ninth gallery, is now underway again, and preparations are being made to drift east also at the same depth. It is rumored that a new adjustment with the Moecow gives to the Opbir company 2,700 shares stock at $15 per share, togetber with 800 feet of ground in the former claim, leaving 1,400 shares of stock, and the balance of the ground in litigation, to the Burning Moscow company.

Chollar receded from $395 to $375@$370, and sold yesterday at $335@340. Potosi rose from $350 to $375, cash, and $380, buyer 30, dropped to $338½, then sold at 320, and closed at $328. Advices from these mines are regarded with favor by those who seem to be well informed as to their real condition. Duriog the week ending October 27th, 412 tons of ore were seut to custom mills, yielding $38 @$40 per tou, lees $17 per ton for hauling and reduction. In the same week 350 tons of ore were sold at $8, and 10 tons at $35 per ton. In the Potosi ground, the Grass Valley station is eaid to look well, and the drift from the Bajazette level, running north, continues in good ore. In drifting eouth from the fifth etation a emall body of "splendid black sulphuret ore" has beeu met with this week. The Grass Valley station of the Chollar mine shows considerable improvement, and is now paying better than any other portion of the claim. In the old workings between the third and fourth stations, the southeast drift bas been driven tbrough to the east eide of the ore limit, and discloses a larger body than was thought to exiet at that point. Tbc new ehaft has been timbered to a depth of 475 feet, and a drift will be started at once.

Hale & Norcross has been sold within a range of $300@$260, closing at $260. Empire Mill and Mining company advanced from $170 to $182, and closed at about $155. From the upper levels of the north and south mine somo good ore has been taken recently, and preparations are being made to sink still deeper from the 600-feet level. Overman has been sold within a range of $88@72, closing at $74.

Imperial fell from $192 to $185, rallied to $187½, receded to $170, then sold $175, and closed yesterday at $172½. The last "clean up" from the company's two mills shows a decided improvement in the ore reduced recently, and yielded $46.000, making the aggregate receipts since 10th of Oct. (including balance of $21,000 then on hand)—about $118,000. During the month of October, extraordinary disbursemeuts, amounting to $25,000, were made in payment of taxes, supplies purchased some time since, and the first installment due on account of tbeir new mill, but tbe regular dividend will be declared to-day, leaving a surplus in tbe treasury of the company. The entire expenses for the current month will probably not exceed $60,000, and with the addition of tbe Lindauer mill, larger receipts may be anticipated than in October. A full month's reserve of ore bas been accmluated at the Rock Point mill.

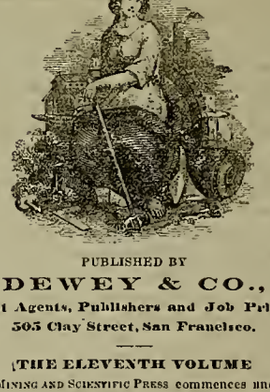
New Volume

— OF THE —

Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).



PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers,

505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Mechanical.

WORKING STEAM EXPANSIVELY.

Government has just spent about $30,000 at the Novelty Iron Works, New York, to determine whether any, and if any how much, advantage there is in working steam expansively. The experiment has proven a most excellent advertisement for the wealthy company which has furnished the facilities for carrying it out; besides affording a most profitable job to the same company. But the government is rich; it has plenty of money, and why should it economise. Now, if a private individual wished to ascertain the same thing, he would be very likely to go to some party who is running an engine to do a certain amount of work. He would make an arrangement by which the engineer should run one week with the throttle valve open, and regulated only by the links; and the next week he would have it work the steam expansively. A carefully kept fuel account would show the advantage, to all practical purposes, as well as the costly machinery prepared for this purpose at the Novelty Works. But then government never counts the cost; government don't have to work for its money; it taxes the people. Intelligent engineers knew long ago, by practical experience, that there was economy in working steam expansively. Government, however, has just found it out, at an expense of $30,000. It will be years, however, before red tape will allow it to be put in practice in government works. An engineer on the New Jersey railway, who used the half-stroke cut-off was asked, long before the government trial was instituted, how much he saved by working expansively. He replied: "When I run to Newark, without the cut-off, I burn three plump tiers of wood; but when I use the cut-off, I burn two." Will the costly government trial prove anything more practical?

To Stop Runaway Horses.—Mr. Rosenfield, formerly of the firm of Hutchings & Rosenfield, in this city, has invented an arrangement for preventing accidents or injuries by runaway horses. This invention, is called the "Safety Whippletres," and is so arranged that in case a horse or horses attempt to run away, the driver can, by pulling a strap, immediately set them free from the buggy or carriage, and thus prevent the possibility of any injury to the vehicle or its occupants. Though very simple, when examined, and very cheap, this invention, if used, will enable people to be as safe from accidents while they are riding as they are while walking.

Improvement in Mastic Roofing.—Messrs. Skinner, Duncan, and Merighi, of this city, have obtained Letters Patent through our Agency for a new combination for mastic roofing, the combination of which is such that it is said to be impervious to heat and cold, and is not easily subject to be attacked by fire. The rays of the sun having no effect upon it, the material will not run in summer and leave seams through which the water may leak during the autum and winter rains; neither does the cold crack it in winter so as to leave crevices through which the water may penetrate into the building. We cordially recommend this roofing to builders.

New Enameling Machine.—Mr. McEachren has received letters patent from the United States, through the Mining and Scientific Press Agency, for a new emaneling machine, for enameling moulding, which promise to be a great improvement over the old system. Mr. McEachren, with others, has lately started a manufactory for looking-glass and picture frames, on Fremont street in this city, where he has several of these machines in use. His claim is as follows: A movable bottom for raising the work or moulding up and out of the enamel or paste substantially as described; and in combination with the enameling baths, he claims the steam chamber for heating the bath and keeping it hot. He also claims the combination of the traveling carriage hopper, and enameling tool, all substantially as described and for the purpose set forth.

A New Method of Corking Bottles.—A gentleman named Woolaver, residing at Suisun, Solano county, has obtained patents for two new methods of corking bottles. The value of these inventions lies chiefly in the use of the bottle for holding champagne, soda water and effervescing liquids. The mouths of the bottle—for it has two—are in the sides of the neck, instead of the top, as in ordinary bottles. To draw out the contents of the bottle, a tube is used with a hole on the under side, a button being placed at each side; by lifting a lever the contents forces itself out at the opposite side, and by drawing the lever back the bottle is effectually closed.

The other device is simply a cork placed longitudinally with the neck of the bottle, and is opened by means of a pair of forceps, with a hole on the under side. With these forceps the cork is compressed till the tube enters far enough to admit of liquor passing through the hole in the tube, which passes it into the glass or vessel—the cork stopping the bottle as soon the pressure of the forceps is removed. These are simple and useful inventions. Applications for patents (which have been ordered to issue), were made through the Mining and Scientific Press Agency.

More about the Diamond Drill.

We have seen a trial of the diamond drill in blue flagstone. A core, 1¼ inches diameter and 10⅝ inches long, was cut out by it in four minutes. The hole made was 1⅞ inches diameter; the feed was at the rate of 56 turns to 1 inch. Another hole, 19¼ inches deep, was bored in 7½ minutes, the rate of feed being 78 turns to one inch. Another hole, 9¼ inches deep, was bored in 3½ minutes, at the same rate of feed. The boring averaged about 2.6 inches per minute. The company guarantee it to cut four inches per minute in North River bluestone, sandstone, marble, and slate, and two inches in granite and harder rocks. With the fast feed it would have been greater had there been more steam; all the steam came 50 feet, through a ¾ pipe, with several elbows. The core, which we brought away, is quite straight, and others that we saw appeared so; and the surface is very smooth. Holes bored in this way will be true, and smooth enough for first-rate stone-work; and drills may be made to cut holes and columns a foot or more in diameter, and of any length required.

The kerf cut is 5-16ths thick; and the power consumed is what is necessary to pulverize this amount of stone. Two men worked a drill about half as fast as it was worked by steam, showing that the power required is moderate; and a steam or compressed-air engine, of simple form, may be used.

The only question is. the durability of the diamonds. If the feed is violent, they may be broken; but when the feed is properly graduated they are not broken, and do not appear to be worn.

In France, where the invention originated, diamonds, set differently, are used to dress burr-stones; and it is claimed that they work more economically than the old tools.

The borers we have seen are made to set, with bayonet joints, on the ends of tubes. There are six diamonds in each; so set as to cut a kerf in which the metal can turn without touching. A stream of water runs in through the tube, and out around it, and washes out the *debris*.

It is claimed that the principle may be applied with advantage to sawing stone; and that very hard stones may be cut by the diamonds, as easily as marble. A chambering drill has been made on this principle, by which the hole at the bottom may be enlarged to twice the size of the main hole.—*American Artisan.*

Preparation for Preserving Leather. The Shoe and Leather Dealer's *Reporter*, good authority, gives the following receipt for a preparation to ensure great durability to leather, and to make it pliable and soft:

The preparation consists of four articles, tallow, soap, resin and water. These ingredients are prepared as follows: Twenty-one parts of tallow are melted in a vessel, three parts of rosin added, and the two when melted mixed well together. In another vessel seven parts of good washing soap are dissolved in seventy parts of pure rain water. After it is dissolved and the mass heated to the boiling point, we add the part prepared before, let it boil once more gently, and the preparation is ready for use. It is especially adapted to boots, harness leather and beltings.

A photographer of Cleveland, Ohio, is about to explore the Mammoth Cave of Kentucky for the purpose of taking views of its interior, by the aid of strong chemical lights.

Manufacture of Glass.

All writers on the subject of glass manufacture fail to show anything decisive upon the precise period of its invention. Some suppose it to have been invented before the flood. Nervi traces its antiquity to the time of Job.

The first glass houses, well authenticated, were erected in the city of Tyre. Modern writers upon the fact generally refer to Pliny in establishing the fact that the Phœnicians were the inventors of the art of glass-making. The tradition is that the art was originally brought to light under the following circumstances: A vessel being driven by a storm to take shelter at the mouth of the river Belus, the crew were obliged to remain there some length of time. In the process of cooking, a fire was made upon the ground, whereon was abundance of the herb "kale." That plant burning to ashes, the saline properties became incorporated with the sand. This causing vitrification, the compound now called glass was the result. The fact becoming known, the inhabitants of Tyre and Sidon essayed the work, and brought the new invention into practical use. This is the tradition; but modern science demonstrates the false philosophy, if not the incorrectness of Pliny's account; and modern manufacturers will readily detect the error, from the impossibility of melting silex and soda by the heat necessary for the ordinary boiling purposes.

It is a well-authenticated fact, however, that there were whole streets in Tyre entirely occupied by glass-works; and history makes no mention of any works of this character at an earlier period than the time mentioned by Pliny.

It was during the reign of Nero, so far as we can discover, that the first perfectly clear glass, resembling crystal, was manufactured. Pliny states that Nero, for two cups of ordinary size, with handles, gave 6,000 sestertia, equal in our currency to about £50,000; and that rich articles of glass were in such general use among the wealthy Romans as almost to supersede articles of gold and silver. It is not strange that the strict secrecy with which the business was conducted in the middle ages should have invested the art with an air of romance; and legends, probably invented for the purpose, created a maximum of wonder among the uninitiated. The Government of Venice also added, by its course, to the popular notions regarding the high mystery of the art, conferring, as it did, the title of "Gentleman" (no idle title in those days) on all who became accomplished in the manufacture. Howell, in his *Familiar Letters*, dated from Venice in 1621, says: "Not without reason, it being a rare kind of knowledge and chemistry, to transmute the dull bodies of dust and sand, for they are the only ingredients, to such pellucid, dainty body as we see crystal glass is."

A French writer, who published an elaborate work upon the subject of glass manufacture, after it had been introduced into France, gives an interesting account of the rise and progress of the art in that country, the encouragement it received, and the high estimation in which it was held. After stating that it was introduced in France from Venice, he says:

"The workmen who are employed in this noble art are gentlemen, for they admit none but such. They have obtained many large privileges, the principal whereof is to work themselves, without derogating from their nobility. Those who obtained these privileges first were gentlemen by birth; and their privilege running, that they may exercise this art without derogating from their nobility, as a sufficient proof of it, which has been confirmed by all our kings; and in all inquiries that have been made into counterfeit nobilities, never was any one attained who enjoyed these privileges, having always maintained their honor down to their posterity."

Baron Von Lowhen states, in his *Analysis of Nobility in its Origin*, that "so useful were the glass-makers at one period in Venice, and so considerable the revenue accruing to the republic from their manufacture, that to encourage the men engaged in it to remain in Murano, the Senate made them all burgesses of Venice, and allowed nobles to marry their daughters; whereas, if a nobleman marries the daughter of any other tradesman, the issue is not reputed noble."

Patent Office Reports for 1864.—The engravings for the Patent Office Reports for 1864, are rapidly approaching completion. They are being prepared by Messrs. E. R. Jewett & Co., of Buffalo, New York. The "line engravings" are said to be executed in the highest style of art, and under a patented process.

Nails made of wire of various sizes, from a ¼ of an inch down to 1-32d. are still used in France. The points are conical, about 60°. They may be driven without splitting the wood. A common pin, when driven into the edge of a thin piece of wood, splits it; but if the tapered point be cut off, and a conical point made, it may be driven without splitting. In making small models of soft wood, we have used steel pins with conical points, made of pieces of knitting needles. They drive well, and hold fully as well as brads. We believe that tapered nails are not so good, for some uses, as prismatic nails with pyramidal points would be; or perhaps wedge ends, for convenience of manufacture, would be better. They would not split the wood; the wedge point, if about 60°, would crush a little at a time, and make a hole for itself, whereas a long wedge or tapered point in its effort to crush a greater amount at a time, splits it; that is, the power required to crush so much is more than is required to split the piece. Let any one file the ends of parallel nails that he finds among common nails, and try them, and he will find that they will be safer to drive where there is danger of splitting. The French wire nail is expensive; but it is worth using for some purposes. For delicate work such nails, made of brass wire, with heads like screw heads without nicks, would be good. If a good machine could be invented to make nails of this kind cheaply, we think it might be worked with profit. But parallel cut nails with wedge points can be made cheaply, and we think a few should be tried.—*Amer. Artisan.*

Useful Invention.—Mr. B. M. Esterle of this city has invented a novel, simple, and apparently very effectual contrivance for enabling vehicles to cross railroad tracks, or to raise themselves out of a track when running in it, without danger of upsetting or straining the vehicle. It consists of a simple key or flange, from half an inch to an inch in width, and quarter of an inch or more in thickness, according to the weight of the vehicle, fastened to the rim of the wheel at each alternate spoke, on a level with the face of the tire. In turning out of a railroad track or crossing it diagonally the flange catches on the iron of the track and lifts the carriage out with scarcely a perceptible jolt or strain, and as quickly as the carriage could be turned on the pavement. The invention is exceedingly simple, and appears fully to answer the purpose for which it was intended. A caveat for the invention was sent on to Washington by the last steamer through the Mining and Scientific Press Patent Agency.

A New Invention.—We learn that I. S. Crall, the Superintendent of the American claim near Birchville, has invented a pan which it is claimed will surpass anything of the kind in use. It is something similar to the Baux & Guiod's pan, but works much faster, and at the same time saves machinery. The new invention is called the waltzing pan, and has, in addition to the circular motion of the shoes a shifting from side to side. We understand that one of these pans will soon be at work at the American claims. A patent has been applied for by Mr. Crall and the new invention will soon be fully described through the Mining and Scientific Press.—*Nevada Transcript.*

Work and Inventions.—Mr. Mill tells us in his Political Economy, that the labor-saving inventions of modern times have not yet lessened the daily labor of mankind. The steam engine does the work of about one thousand millions of men—more men than there are in the world—and this inconceivable addition in the world's working force has all accrued in ninety years; yet no man finds his day's work diminished by it. On the contrary, we work harder than we did ninety years ago, and hardest where there are the most steam engines. The farmer on our western prairies, by the aid of the mowing machine, gets in, in one week, a crop which his father could not have got in by working till the grain dropped over-ripe from the straw; and then he thrashes, in six hours, more than his father could have flailed out in a whole winter. But he works harder than his father did, winter and summer. Ladies have made the same remark upon the sewing machine; they can sew at a pace that would have made their grandmothers gasp to see, but their sewing is never any nearer *done* than it was when they set every stitch by hand.

We believe it will be so to the end of the chapter. We do not believe that any possible development of invention will ever much lessen the amount of human toil. As long as the world stands, we think the world will daily require, for carrying on its business, its entire daily revenue of force.

Patent Received.—Mr. S. D. Sexton of Los Angelos has received the patent for his "Improved Quartz Crusher," which issued Sept. 5th, 1865. The above is the fourth patent which has been issued upon the inventions of D. Sexton, who is constantly at work setting forth new ideas to the world.

California Inventions.

Within the past three months, the Patent Office of Washington has granted letters patent for the following new inventions made by residents on this coast, through the agency of the Mining and Scientific Press. A number of these patents arrived by the Colorado. A large number of additional applications forwarded during the same time, are still before the Commissioner awaiting examination.

G. H. Pond, of San Francisco, for a new process for crushing quartz.

To Dr. W. M. Butler, of San Francisco, for a new mechanical chair, for the use of dentists and hair dressers.

To Dr. W. M. Butler, of San Francisco, for a new form of spittoon for the use of persons while undergoing dental operations.

To Michael Howard, of San Francisco, for a liquid to be used for restoring hair on persons afflicted with baldness.

To Jacob Price, Jr., of Petaluma, for a new form of hay press, for baling hay.

To Geo. Mallear, of San Francisco, for a new form of plane, for the use of carpenters and cabinet makers.

To Wheeler & Randall, of San Francisco, for a new form of amalgamating pan. The tractory conoidal.

To Skinner, Duncan & Merighi, of San Francisco, for a new process in making mastic for roofing and other purposes.

To Benjamin McEachern, of San Francisco, for a new process for enameling mouldings for looking-glass and picture frames.

To A. C. Austin, of San Francisco, for a new form of machine for crushing quartz.

To John Woolaver, of Suisun, Solano county, for a new form of bottle for holding effervescing liquids.

To Chas. Thiery, of Virginia City, Nevada, for a new form of amalgamating pans.

To John Woolaver, of Suisun, Solano county, for a new process for corking and drawing corks from bottles.

To F. G. Belknap, of Washoe City, Nevada, for improvements in the manufacture of amalgamating pans.

To Paschal Varnum, of San Francisco, for a new composition for making floors and sidewalks.

To Milton A. Wheaton, of San Francisco, for an improvement in the form of and use of mowing machines and harvesters.

To Earl F. Hough, of Martinez, for a self regulating windmill.

Several of the above inventions have already been fully described in our columns; a portion are described in the present issue, and others will be more fully noticed hereafter.

Retired.—Joseph O'Keefe, a partner with the brothers Watt, of Grass Valley, in the famous Massachusetts Hill mine, has retired from active participation in mining affairs, and established himself with his family in a splendid new residence, which he has recently erected near San Jose. His place is said to be one of the finest in the State, and consists of nearly a hundred acres of land, covered with grass, orchards, and shrubbery, and watered with a beautiful stream of water. Mr. O'Keefe still retains his interest in the old mining property, from which he has realized his large fortune, and has also quite recently bought a quarter interest in another valuable mining property in Grass Valley, known as the Hartery claim.

Valuable Church Property.—Trinity is not the only New York church whose property is estimated by millions of dollars. The Collegiate Church, so called, the earliest formed Dutch church in that city, holds property valued at $4.000,000, with an annual income of about $150,000. The property was left by one of the elders of the church, and consisted originally of a piece of *swamp land*, then of but little value. It was left to support the ministry; so the church keeps *four* pastors—to which it pays $7.000 a year each—requiring but a small portion of the present income. The other Dutch churches have sued for a division of the income among all the churches of that faith in the city, contending that such was the intent of the donor.

Price of Labor in Austin.—Common laborers command $4 per day; carpenters, $7; joiners, $6, and masons $8 to $10. Board per week, $10.

Dividend.—The Jefferson Gold Mining Company has declared another regular dividend of fifteen dollars per share.

The Eel River Navigation Company.—We last week noticed the organization of this company. The company evidently mean business, as they have already put on their first vessel, the schooner May, which is to sail in a few days direct to the mouth of Eel River. It has generally been considered impossible for vessels to enter the mouth of this river; but recent explorations have proven that it is quite practicable to do so with vessels of light draught. Indeed the river was entered in 1850 by the J. M. Ronison, which vessel sailed up the river some four miles, supposing she had entered the Trinity, which river she was in search of. The opening of this river is very important in view of the growing oil interest in that region. All the oil from the Mattole and Bear rivers has now to cross Eel River on its way to Eureka, for shipment to this port. If it can be placed on shipboard at Eel River, the price of freight will be greatly reduced, and much additional value given to the entire oil region of Southern Humboldt. The oil, which it is confidently expected will soon be found in the Eel River valley, can be shipped almost directly from the wells. An important fishing and agricultural interest will also be opened up by the success of this new enterprise. May it prove a success in reality.

Gold Hill Drinking Water.—An analysis of the drinking water supplied to the residents of Gold Hill has been made by Messrs. Richard and Wiegand, from which it appears that it is more healthy for use than the water generally furnished large cities. It contains but a mere trace of organic matter, the usually fruitful source of disease in water; but shows 19.74 grains of mineral matter to the gallon of water, made up as follows:

Sulphate of lime	11.35
Sulphate of magnesia	7 63
Sulphate of soda	0.65
Carbonate of soda	0.11
Free soda	traces
Organic matter	traces
	19.74

No arsenic or any other matter especially injurious to health was found. It is superior even to the Truckee river water, which one would suppose to be as pure as any mountain stream. The only inconvenience attending its use is found in washing, when a portion of the soap is decomposed, and attended with the formation of various insoluble combinations of lime and magnesia, which float on the surface and adhere to the sides of the vessel; but this inconvenience may be corrected by the use of alkaline and carbonates, and other chemical substances. The same water is furnished to Virginia City also.

California Coal Interests.—The agricultural, mechanical and mining interests of California never were anything like as promising as they are at this time. Among the especial branches of mining, the coal interest is rapidly assuming a large degree of commercial importance, and the home product is fast driving foreign coals out of the market, and very properly keeping our money at home to support our own mines and mechanics, and aid in providing a market for our agriculturalists. During the first three-quarters of the present year, the receipts of coal at this port have been as follows:

	1864.	1865.
Eastern	tons. 40,252	21,801
English	9,568	5,277
Scotch	3,291	246
Sydney	16,591	8,374
Vancouver	12,449	8,463
Coose Bay	1,070	1,085
Bellingham Bay	5,975	7,920
Total imported	tons 89,196	53,166
Monte Diablo	30,593	41,766

This gives a pretty large decline in imported, and over 30 per cent. increase in Monte Diablo. Of the imported coal, Bellingham Bay alone shows an increase. The receipts from Nanaimo show a decrease as compared with last year; but the last quarter they have been about 4,000 tons. The demand, then, for that coal has been large—much larger than the Vancouver Coal Company have provided the means of supplying.

The Oregon Agriculturist is the name of a new paper just started in Salem, Oregon. It is a quarto, with a beautifully-engraved head, and altogether the neatest got-up paper north of California.

A Pen-Picture of Pithole, Pa.

We gave a short notice last week, of the remarkable opening in the earth in Pennsylvania known as Pithole, and which has given its name to a valuable oil district which has recently been developed in its immediate vicinity. A correspondent of the Chicago *Times* gives the following pen-picture of these wonderful oil wells; which will no doubt answer for a description of most other large flowing oil-wells:

We first came to the United States, the mother of Pithole. It was with some difficulty that we found the well, the derrick being completely surrounded by tanks, each of the capacity of 1,200 barrels, and the oil flowing from one into the other as fast as they respectively became filled. Advancing with eager curiosity toward the great sight, the visitor is somewhat startled by the abrupt question, "Any matches about you?" and without stopping to see whence comes the voice, demurely and vacantly shakes his head, whether he has matches or not. He is then allowed to climb the greasy ladder which overlooks the tank into which the oil first flows. Hardly grasping the novelty of the position, though holding tightly to the ladder, and almost stifled with the carbonated gas, to which he is unaccustomed, he looks in vain for the source, but finally succeeds in finding it, a spontaneous spouting forth of greenish fluid, from a pipe about the size of the wrist, which makes some men rich and some men crazy.

Splashing against the sides of the tank, and throwing the liquid over everything in the neighborhood, it pours forth a stream of pure oil of about 700 barrels a day, regularly breathing in its flow, and with the noise of a ten-horse power engine. Passing on, we come to well No. 54, also on the Holdemn farm, the whole of which was leased some time ago by the United States Petroleum Company. This is a larger well than the one just left, was "struck" only eight days ago, and gushes forth with all the impetuosity of youthful vigor. The stream of oil is larger but scattering, and with much more gas, makes the noise of a steamboat, quick, heaving and puffing. Being the newest, and taking advantage of the excitement, it is claimed as a 2,500 barrel well, but it actually flows about 1,200 or 1,300 barrels per day. But a few yards farther on is No. 19, or the Grant well, the Phillips of the present day, whose flow is more steady and quiet, but is a thicker stream, and whose yield is at least 1,500 barrels per day. Then comes the two Twin wells, and the Island well, making in all the production in a small center over 5,000 barrels in every twenty-four hours.

This valuable property has recently been sold to some Chicago capitalists for the snug little sum of $1,500,000. These wells are on leased property, and the income from the leases to the parties who hold the franchise is said to range from $4,000 to $5,000 per day.

The Medicinal Qualities of Kerosene are as yet but imperfectly understood. That it does possess such qualities, to a reasonable extent, is generally acknowledged. What it will accomplish must be learned by experience. We have frequently heard it spoken highly of as an external remedy for rheumatism, but never, until we met the following paragraph from the Folsom *Telegraph*, have we heard of its being used internally for anything. The article appears to have been written in good faith; if so, would it not be well for some of our medical practitioners to try the experiment in their practice, and give the world the benefit of their experience? We copy as follows:

At Alder Creek, a miner named Joseph Dobson, had been for the last six or eight years grevously afflicted with imflammatory rheumatism, so much so, as to be hardly able to drag himself along with the aid of crutches. The ordinary remedies failed to give him any relief, and he gradually grew worse. Some person finally recommended the use of kerosene. He first applied it externally, and found immediate relief, and continued growing better; at length he commenced taking it internally, and accustomed himself to two drinks a day, until he had so far recovered as to obtain the full use of his limbs. A few days ago he wheeled a wheelbarrow loaded from the station at Alder Creek to the American River, a distance of nearly half a mile. He attributes his recovery alone to the use of kerosene, and has thrown all other medicine to the dogs.

Treasure Shipment.—The Colorado, which sailed on Monday last, took away a large passenger list, and $1,141,822 in treasure; $700,447 of which went to New York, $20,000 to Panama, and the balance, $421,375, to England.

Ballooning in New York.—Prof. Lowe has filled up an inclosure in New York, where he gives daily balloon exhibitions for two bits a head. Any one is allowed to go up in his balloon for $5, or two can go up for $2.50 each. The Professor always ascends with them to manage the "machine." The balloon he uses is able to take up five; but he considers three a "load." His latest sensation announcement is that he has a splendid bridal car in process of construction, in which he will take up any romantic pair, with an officiating clergyman, who may be desirous of taking upon themselves the marriage vows among the clouds; himself going as witness to the ceremony! The balloon is let up to a height of 1,500 feet by a cord and windlass, worked by brakes, and hauled down by horse-power; the signal for coming down being given by a shrill whistle from the æronaut. About five minutes are occupied in coming down—less time in the ascent. The view from the upper end of the rope is said to be magnificent in a clear day, and the sensation delightful. An extra rope is attached to the balloon to guard agiust accidents.

Remarkable Escape.—A little boy about three years old, strayed away from his home, in Virginia City a few days since, and fell into a shaft 130 feet deep, where he remained from the afternoon of one day until near night on the next. A little pet Newfoundland dog accompanied him in his truancy and fall. Both were rescued without any material injury to limb or body. The shaft was sunk from the floor of a tunnel about 150 feet from its mouth, on the Ophir Company's ground; but being so far into the tunnel was not observed by the people in looking for the lost one, until the father, in his agony of search, strayed into the tunnel, noticed the shaft and called aloud down its dark recesses as he had already done in scores of others; but unlike the others in this case, the answer came back "Oh Pa!"—The lost one was found.

A Scene at the Battle of Five Forks.—On the left of our line the rebels fought with stern determination. A colonel with a shattered regiment came down upon us on a charge. The bayonets were fixed; the men came on with a yell; their gray uniforms seemed black amid the smoke; their preserved colors, torn by grape and ball, waved defiantly; twice they halted, and poured in volleys, but came on again like the surge from the fog, depleted, but determined; yet in the hot faces of the carbineers they read a purpose as resolute, but more calm, and, while they pressed along, swept all the while by scathing volleys, a group of horsemen took them in the flank. It was an awful instant; the horses recoiled; but at once the rebels, with rare organization, fell into a hollow square, and with solid sheets of steel defied our centaurs. The horsemen rode around them in vain; no charge could break the shining square, until our dismounted carbineers poured in their volleys afresh, making gaps in their spent ranks, and then in their wavering time the cavalry thundered down. The rebels could stand no more; they reeled and swayed, and fell back broken and beaten; and on the ground their colonel lay, sealing his devotion with his life.

A Character.—I do not know any object more interesting, in social life, than an amiable young lady receiving her company, ministering to their amusement, mingling in every little tide of talk, and directing the while the whole pleasant, but intricate machinery of a party. It requires something that may be called talent to entertain company with grace and ease—to draw out the retiring character of the reserved—bring congenial spirits into acquaintance and fancy its glittering flashes. A large party contains various dispositions, tempers, antipathies, &c. These are the materials out of which are to be constructed pleasure, delight, and enjoyment. It is the peculiar province of woman, in polite society, to cement the different elements of happiness together by her plastic hand. In such a situation her skill is most seen as well as felt.

A new religious movement has been started in England. It is proposed to unite the members of the English Roman Catholic and Greek Churches in friendly communion, and the public journals report that 300 churches in England assent to the measure.

A sale of naval vessels at Brooklyn navy yard has lately taken place. The vessels brought unusually good prices, and some were sold for more than Government paid for them.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Nov. 4, 1865.

A NEW EMPLOYMENT FOR CAPITAL.

Active measures are being taken to call the attention of capitalists to the wonderful and extensive deposits of iron ore, which it is well known exists in many portions of California. One of these deposits, and probable the most valuable of any, is located in Sierra county, and not far from Sierra City. This belt of ore extends, so far as known, some thirteen or fourteen miles in length, and 1,000 feet wide. The quantity in sight, it is estimated, will exceed 2,000,000 tons. The ore is of a very superior character and quality, and remarkably free from such impurities as are generally found to present the greatest difficulties to the smelter. The location is in the center of one of the richest mining sections of the Pacific coast, and almost directly upon the great highway passing across the Sierras from California to Nevada. For miles around the neighborhood of this deposit the hills are covered with the finest timber, which will afford an abundant means for the production of charcoal, the very best character of fuel that can be employed in the production of iron ore, when it can be obtained at a small cost, as it can be in this locality. The fuel generally employed in England and Pennsylvania, for the production of iron, is mineral coal, which is there the cheapest material that can be commanded; but the justly celebrated iron of Sweden, Norway, and Russia, owes its superiority chiefly to the fact that it is produced by charcoal instead of mineral coal. In California and Nevada, where transportation forms so large a percentage in the cost of iron at the mine or mill, it would appear most especially desirable that the quality of iron should be of a high grade, as it costs no more to transport such than it does an inferior iron, which, from its indifferent character, must soon be thrown aside for new. More attention than heretofore is beginning to be drawn to this consideration, and the employment of steel, even, in many cases, especially for shoes and dies, it is thought would be an economical move.

Gentlemen of large experience in iron smelting operations have examined the above-mentioned locality, and carefully counted the cost which will be required to produce iron there. Their conclusions have been most particularly favorable. Some have estimated that a good quality of iron can be made at a cost not to exceed twenty or twenty-five dollars per ton, a rate at which its manufacture must prove highly remunerative.

For the profitable reduction of iron ores, four things are mainly needed, viz., timber, fuel, a convenient market, and a suitable quality of material needful in erecting smelting furnaces, all of which should be obtainable easily and without great expense. The former, as we have already shown, exists in the greatest abundance, and with it is afforded every opportunity for producing the best of fuel at a reasonably cheap rate. The position of the deposit, directly in the midst of the finest mineral country on the globe, and within eighteen or twenty miles of the proposed route of the great continental railroad, affords every facility for turning the product of the furnace cheaply to a good account; while in close proximity is found in great abundance a class of grey sandstone, singularly fitted for building furnaces, and, moreover, proved to be the best kind of such material, it having been fully tested by extensive use in the numerous smithies in that neighborhood. All those who have had occasion to use this sandstone for similar purposes, assert that it is fully as well adapted for building smelting furnaces as the best English fire-brick.

In fact every circumstance seems to combine to point out this as a most favorable opportunity for the initiation of a new branch of business in California, which, when once inaugurated, is destined to call into active use a vast amount of capital, and afford profitable employment, directly and indirectly, to many thousands of people.

A NEW MOVEMENT.

Some of the principal Eastern railroads have under discussion the propriety of adopting some speedy and efficient mode of cutting off the large extra expense with which the public is now taxed, under the "Express" system, and by which the railways are also deprived of a large amount of business which properly belongs to them. Freight intrusted to these express "transportation companies" travels no faster than ordinary freight, and there is no reason why merchants should not place their goods into the immediate charge of the railroad companies. The only labor the express companies perform is the collection of extra freight over that which they pay to the railroad companies, and which they disburse in the shape of large dividends to their various shareholders. The railroad companies might as well receipt for what now passes through "express lines" as that which does not, but still goes over the road on the same train. The enormous tax, charged by express companies, enables their proprietors to divide hundreds per cent., while railroad companies, who invest all the money and do all the work, can seldom derive six per cent. on their investments. A large and respectable committee, representing such roads as the New York Central, the Pennsylvania Central, the Baltimore and Ohio, and other roads, has been appointed to consider the matter, and arrange for a speedy suppression of the "express" innovation. A system has long been in use between the Western and Eastern States by which heavy freight is transferred from one company to another, and from railroad to steamboat, thus passing without confusion and without through attendance from one end of the Union to the other, the sender knowing no other party than the one to whom he delivers his freight, and the receiver none than the one from whom he receives it. Every railway stockholder, and almost every individual member of the community, is interested in the success of this movement—a movement whose legitimate object and result is to keep *millions of dollars annually* where it properly belongs—in the hands of producers and consumers, instead of frittering away that vast sum to no purpose, in the shape of commissions to parties who create no values.

THE MINING AND SCIENTIFIC PRESS locates the French Mill at Grass Valley. That will be news to the owners of the mill. They suppose it to be located upon Little Deer Creek near this city.—*Nev. Transcript.*

"The French Mill," and the one which we probably supposed was alluded to, is located on Wolf Creek, in Grass Valley, where it has stood for the last ten or twelve years. We are also well aware that a mill, sometimes known as "The French Mill," is located on Little Deer Creek near Nevada City. That mill has also been standing some ten or twelve years.

THE GREAT PETROLEUM SHAFT.

We mentioned, some two or three months since, that a party of capitalists, who had made money out of oil, and who were tired of trying to see things with their eyes shut, and *speculating* as to the precise appearance of things "down below" where they make the oil, had resolved to make an effort at least to look upon the oil rocks with their eyes open, and with that view had organized a company to sink a deep shaft for that purpose. The company has been organized, and is now fairly under way. They have selected a locality known as Petroleum Centre for the scene of their operations, where they are now, by the aid of pick and shovel, going bodily down stairs, for the purpose of giving dame Nature's oil locker a close personal inspection. The shaft is of liberal dimensions, seven feet by fourteen, and is to be sunk below that mysterious place where so much money has been buried—"the third sand-stone." The *Oil Register* says that "the result of this exploration is awaited with curious interest, though when we consider the variety of locations and conditions wherein oil has been discovered, we can hardly see how they are to gain any *portable* knowledge, unless they can carry the hole about with them. But as the first direct inquisition of nature in broad daylight, it may, at least, possess a scientific value."

Here in California there is no need to dig such deep holes to get down to the oil rocks; for Nature, in some of her antic moods in ancient times, has turned herself pretty well upside down, and tilted her "third" and all other sand-stones, and intermediate "layers" as well, up to the light of day. The oil prospector in Santa Cruz and around Mount Diablo, and in the lower part of the Humboldt oil regions, can walk along the surface and examine these "sand-stones" at his leisure. However, they may look a little different "down below," and certain it is that the borings thus far indicate that they are more fully saturated with oil there than they are on the surface. We opine, however, that our Eastern friends will find it a little beyond human endurance to work in a shaft, after it reaches the neighborhood of the "third sand-stone;" they must, moreover, look out for explosions down there. If it is unsafe to light a cigar in the neighborhood of the mouth of an oil boring, what will they be able to do with a lighted candle in an open shaft of that depth? A Davy lamp wont save them.

FOR RESTORING THE HAIR.—Mr. Michael Howard, of this city, has obtained a patent through the MINING AND SCIENTIFIC PRESS AGENCY, for his Hair Restorator. The Professor thinks (and we believe with good reason), that he has discovered in the abundant vegetable kingdom of this coast, a preparation which will restore the hair to its pristine growth. We would advise all bald heads to "go up" and try the Professor's skill.

STRUCK GOLD.—The workmen engaged in the construction of the Russo-American Telegraph line, while setting posts about 150 miles above Quesnella mouth, are said to have struck a gold placer prospecting from seventy-five cents to one dollar a pan. Result—a temporary suspension of telegraph construction for the more profitable employment of gold mining.

IMPORTANT TO SILVER WORKERS.—Persons engaged in the amalgamation of silver ores will do well to read attentively the present number of Prof. Lauszeweert's series of articles on "The Problem of Gold and Silver Extraction," and also the number which we published last week. His discussion of the economy of the use of dichloride of copper in the pan process, and the employment of a copper amalgam, instead of pan quicksilver, will be found both interesting and useful.

SALE OF A MINE.—The Macedonia Mine, just on the border of the State of California and Arizona Territory, has been sold to a New York Company, for $150,000. The first installment, $30,000 of the purchase money, in gold, has been received in this city.

COFFEE AND SPICES.—Most people relish a good cup of coffee. If there is any one weakness of the appetite which we favor more than another, it is a desire which somehow comes over us about three times a day for a good cup of coffee. This healthful and grateful stimulant forms an important element in the domestic economy of every family, and its consumption in this city alone amounts to nearly fifty tons per month. This great demand has stimulated the establishment of several business houses, which are employing a large amount of capital in its preparation for family use, among which we may mention prominently that of CHARLES BERNARD, at 707 Sansome street, near Jackson, who manufactures about the best article we have yet been able to find in this market; as an evidence of which we may mention the fact that he was awarded the first premium, at the late Fair, for both coffee and spices.

We took occasion, a few days since, to visit this establishment, where we found a large number of hands busily employed in the various processes of roasting, grinding, packing, etc., aided by the tireless arms of a neat little steam engine, of some twelve horse-power. The establishment occupies two entire stories. The roasting is done in a furnace, divided into two compartments, in each of which a large cylinder is made to revolve by machinery, and which are driven back and forth for filling and discharging upon convenient iron slides. The coffee, after being roasted, is first bruised or broken up by several iron balls, rolling in an iron cylinder, which, by a compound eccentric motion, is made to revolve in a zig-zag manner, effecting a perfect and even-breaking of the whole mass. From this cylinder it is run through grinding-mills, where it is still further reduced to the requisite fineness for extracting, to the best advantage, its flavor and strength. Mr. Bernard also prepares all the various table-spices and herbs that are called for in the family economy. His establishment throughout exhibits a degree of neatness and order highly creditable. He commenced this business some ten years ago on an exceedingly small scale, from which small beginning he has built up his present extensive business, which now reaches out into almost every town and mining camp on the Pacific coast. This success is the amplest guarantee of the superior quality of his manufactures. All he sells is guaranteed pure. The famous Chartres coffee, which he manufactures so successfully, owes its name and fame to the city of that name in France, where it was first made by an ingenious Frenchman, who well understood how to properly manipulate this favorite berry in order to obtain from it its most delicious flavor. Mr. Bernard, coming from the same neighborhood, appears to have also thoroughly informed himself of the process, so that he is able to furnish the citizens of San Francisco with an article not at all inferior to the same famous brand which is served up so acceptably to the lovers of coffee in the city of Paris.

HARRIET MARTINEAUX, now in her 64th year, still continues one of the most active and able writers in the British metropolis. She has just sent to press the last volume of her "History of England during the Great Peace." She is now nearly blind, and totally deaf.

HEAVY SHIPMENT.—The Allison Ranch Company, of Grass Valley, shipped to this city, on the 29th ult., by Wells, Fargo & Co., $8,000 in gold, the proceeds of four weeks' work. A pretty good "giving-out" for one mine.

THE SEVENTH CARGO.—The schooner Equity, which arrived in this port on Monday last, makes the seventh cargo of codfish caught in the Pacific which has arrived here this season. This business is rapidly growing to be one of considerable importance.

CROCKETT CONSOLIDATED MINING COMPANY, ESMERALDA.—This company has changed its office from 728 to 605 Montgomery street, and John M. Burnett has been elected Secretary of the Company.

LIST OF OFFICERS OF MINING COMPANIES AND INCORPORATIONS.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

Below we give the date of recent meetings held in this city and the names of officers chosen or appointed. Every bona fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

INDIAN VALLEY G. & S. M. Co., Indian Valley, Plumas County, Cal.—Oct. 17. Trustees: Geo. R. Carter, John Carter, Wm. H. Blood. President, Geo. R. Carter; Secretary, John Pollak; Treasurer, Geo. R. Carter; Superintendent, John N. Blood.

LA BLANCA G. & S. M. Co.—October 10th. Trustees: D. Dwyer, John F. Lohse, H. H. Claussen, E. Wertheimer, H. Engelbrecht. President, David Dwyer; Secretary, Charles Friedberg; Treasurer, E. Wertheimer; Superintendent, F. A. Hartmann.

SEGREGATED BELCHER M. Co., Storey County, Nev.—Oct. 24th. Trustees: J. Sime, F. Livingston, A. K. P. Harmon, E. R. Burke. President, J. Sime; Secretary, Jno. F. Lohse.

EL TASTE S. M. Co., Sonora, Mexico.—Oct. 17th. Trustees: J. O. Rountree, J. B. Roberts, J. R. Mead, B. E. Harris, C. Wiltram, F. Wiltram, F. D. Carlton. President, J. O. Rountree; Secretary, E. C. McComb; Treasurer, F. D. Carlton.

RECENT INCORPORATIONS.

INDEPENDENCE OIL MINING Co., Mattole Valley, Humboldt Co., Cal.—October 3d. Trustees: H. B. Wentworth, George Hill, C. M. Bartlett, John McGinnis, Martin Sanders.

GENERAL GRANT MINING Co., Clear Creek District, Tulare Co., Cal.—Oct. 5th. Trustees: Samuel Reynolds, F. Hagemann, L. F. Lovelnad, J. B. Painter, H. Reed.

HALEY PETROLEUM Co., Santa Cruz County, Cal.—Oct. 16th. Trustees: John J. Haley, A. Rosenfield, William J. Gray, William H. Keith, J. K. S. Latham.

BETTS FARM OIL Co., Mattole River, Humboldt Co., Cal.—Oct 19th. Trustees: Geo. L. Faulkner, Samuel Woods, Wm. S. Haven, Benj. E. Babcock, Edwin Harris.

JENNINGS OIL Co., Humboldt Co., Cal.—Oct. 19th. Trustees: John A. Hooper, John Dolbeer, John Kentfield, Geo. Phillips, J. M. Olmstead.

MORRISON PETROLEUM Co., Eel River, Humboldt Co., Cal.—Oct. 21st. Trustees: Charles Nelson, J. M. Thurston, J. G. Graham, J. W. Crosley, H. Hale.

CALIFORNIA MINING BUREAU ASSOCIATION. Oct. 21st. Trustees: A. J. Snyder, Joseph W. Low, A. Buldwin, J. B. Whitcomb, H. L. Dodge, A. P. Molitor, Cyrus Palmer, Thomas McAuley, John R. Brett.

ECLIPSE MILL AND MINING Co., Gold Hill District, Storey Co., Nev.—Oct. 24th. Trustees: Louis Sloss, W. T. Grissim, W. H. Henderson.

NEW ENTERPRISE.—A New York company has recently purchased what is supposed to be a valuable quicksilver mine, near Mono Lake, and have sent out a large force, consisting mostly of "iatelligeat coatrabands," with able engineers and experts, and all the necessary machinery for working it.

A NEW PAINT.—D. P. Flinn, of Geneva, N. Y., has patented a paint, composed of oxyd of zinc, slacked lime, resin, milk, and linseed oil, which, it is claimed, is better for the inside work of houses than oil paint, inasmuch as it is more durable and retains its white color longer. It dries in two hours.

TERRIBLE OCCURRENCE IN A FOUNDRY.—A laborer came to a horrible death lately in an English foundry. He was charging a furnace with coke and iron, and placed his face to the mouth of the furnace to see if he had put in a sufficient charge, when the flames from the furnace caught his face and head, and burned him to death. He was found in that condition soon afterward by the foreman, kneeling in front of the furnace, exactly in the position he was scorched.

WELL ENOUGH TO KNOW.—The scientific name of the cattle murrain in England is pneumonia peeorum epizotica typosa. The public always demanding that things shall be called by their right names. There is no excuse now for them if they miscall this.

THE *Sentinel* attributes the prosperity of Santa Cruz to the many manufacturing establishments in that place, which pay out every month over $25,000 in gold for labor, all of which is there spent for improvements and the necessaries of life.

A NEW HAVEN telegrapher has invented a new arrangement of sound reading, in which, instead of a pause between each letter, a musical note is sounded.

MINING ACCIDENTS.—Two men, named respectively Dennis Lynch nad Thos Quine, were killed by a cave in the Ophir Mine, at Grass Valley, on Thursday evening of last week, as we learn from the *National*. Lynch was twenty-nine years of age, and leaves a wife and child at Grass Valley. Quine was twenty-two, and had no relatives in this State. The accident occurred from a "slip" which took place within twelve inches of a pillar.

Martin Collins was killed, a few days since by an accident in the Eureka mine, at Sutter Creek, Amador county.

SELF-CULTURE.—Have courage enough to review your own conduct: to condemn it where you detect your faults; to amend it to the best of your ability; to make good resolves for your future guidance, and to keep them.

WHAT DOES IT MEAN.—Orders have been received at the Headquarters of this Department from Washington to prepare quarters at Mare Island for seven thousand marines and sailors. Is Uncle Sam preparing to make a large naval depot on this coast with a view of watching the course of events among our Mexican neighbors?

THE regular army, it is stated "on good authority," will hereafter consist of 50,000 men. This number is expected to be reached within a few months, the average enlistment now being 300 per day, the men being mostly discharged soldiers of the volunteer army.

New Invention.

ROSENFIELD'S PATENT SAFETY WHIPPLETREE—The greatest thing out. The attention of all owners of Horses and Buggies is called to this valuable LIFE and Buggy saving invention, and which can be attached to all buggies and vehicles without any changes in the harness or buggy, and can be easily secured to any carriage in fifteen minutes. The great value of this Whippletree is, that a runaway horse can be instantly detached from a carriage without taking any portion of the vehicle. The public are invited to call and see it, and orders for the Whippletree left at No. 420 California street (northeast corner of California and Leidesdorff streets), Room No. 1, from 10 A. M. to 5 P. M., will be promptly attended to. Letters dropped through the Post Office, Box 1,944, will be promptly and fully answered. 18v11-1m

A Business Compliment.

PETALUMA, Oct. 4, 1865.

MESSRS. DEWEY & CO.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business-like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

AGENTS WANTED

—FOR—

The Secret Service, the Field, the Dungeon, and the Escape.

—BY—

ALBERT D. RICHARDSON,

N. Y. Tribune Correspondent.

1,000 COPIES SELLING PER DAY!

The most interesting and exciting book ever published, embracing Mr. Richardson's unparalleled experience for four years. Travelling through the South in the secret service of the "Tribune" at the outbreak of the war, with our armies and fleets, both East and West, during the first two years of the Rebellion; his thrilling capture; his confinement for twenty months in seven different rebel prisons; his escape, and almost miraculous journey by night of nearly 400 miles. It abounds in stirring events, and contain more of the fact, incident, and romance of the war, than any other work yet published. Horace Greeley says of it:

"A great many books will yet be written concerning this war, in addition to the many already in print; but not one of them will give, within a similar compass, a clearer, fuller, more readable account, entirely from personal observation, of the nature, animus, purposes, tendencies, and instrumentalities of the slaveholders' rebellion, than does the unpretending narrative of Mr. Richardson."

Teachers, ladies, energetic young men, and especially returned and disabled officers and soldiers, in want of profitable employment, will find it particularly adapted to their condition. Send for circulars. Address

MINING AND SOIENTIFIO PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, including a full description, specification, model, duplicate drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely recommend his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A specimen-like sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Cavent is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensue. If the application is rejected we examine the cause thoroughly, in order to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, when practicable, not exceeding twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists merely of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time, but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	20
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of the Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDES, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value, to extend, is all that is requisite, and we are confident we shall receive it.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet having been recently enlarged to the size of Harpers' Weekly is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only repeat the oft-furnished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the donor to extend, is all that is requisite, and we are confident we shall receive it

MINING BLANKS

For Sale

AT THE

OFFICE OF THE MINING AND SCIENTIFIC PRESS,

No. 505 Clay Street, corner of Sansome.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186, accordiug to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]

Dated 186

Assessment Notice.

..... Company

.....

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ....., 186, an Assessment of .....per shnre was levied upon the Capital Stock of said Company, payable on the ..th day of .....186, in United States gold and silver coin to the Secretary.

Any stock on which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186, to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.

Office.....

NOTICE.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186, the several amounts set opposite the names of the res ective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophilus Thistle	23	14	$140 00
Peter Pipe	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ....., 186, so many shares of each parcel of said stock as may be necessary, will be sold at the.....

....., on the ..th day of....., 186, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.

Office.....

☞ Our advertisers are furnished with blank Assessment Sale notices free of charge. Orders from the interior promptly filled, by mail or express, as may be desired.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

REPLACING A COW'S HORN.—The following paragraph appears in an editorial column of Shorthorn intelligence, in a recent issue of *Bell's Messenger:*

Did any of our readers every try the experiment of replacing a horn which had been sloughed or cast? We did so the other day, and with complete success. On Saturday, the 22d of July, a boy brought a horn to us which he had seen one of our cows lose by entangling it in a stile. A friend volunteered to put it carefully on again; and in the course of about twenty minutes from the time of the accident, the cow was once more in possession of a pair of horns. Twenty-three days have passed, and the horn seems as firm as any in the herd. No bandage or fastening was applied.

SAN FRANCISCO.
ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulics, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.
Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.
Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.
Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wahlee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.
BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,
Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.
We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron.
All work done in the best manner at the lowest cash prices.
21v10 H. J. BOOTH & CO.

Miners' Foundry
— AND —
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with despatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as
Steam Engines and Boilers, Flour, Saw and Quartz Mills,
Machinery, Mining Pumps, Amalgamators,
Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.
*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, FREE OF COST.
All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.
HOWLAND, ANGEL & KING.

Vulcan Iron Works Company
[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.
IRON FOUNDERS,
Steam Engine and Locomotive
BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.
The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as
Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and Flouring Mills, Quartz Mills, Sugar Mills, Saw Mills,
Manufacturing Machinery of Every Kind.
Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR.
BEATH'S AMALGAMATOR;
HESSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;
FAUCHERY'S QUARTZ CRUSHER AND WATER WHEEL.
MONVAL'S IMPROVED WATER WHEEL;
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.
STEVEN'S PISTON PACKING RINGS.
They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.
Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

JOHN P. GALLAGHER. JOSEPH WEED.
GALLAGHER & WEED,
BRASS AND BELL FOUNDRY
And Lock Factory.
ALL KINDS OF BRASS AND COMPOSITION CASTINGS AND FINISHING DONE WITH NEATNESS AND DISPATCH.

CHURCH AND STEAMBOAT BELLS, OF ALL SIZES, made to order. Engineers' Gongs made and hung in the best manner. Bank, Vault, Store and Prison Locks; also Brass Padlocks and Shop Locks of various patterns, on hand and made to order.
☞ Particular attention given to casting Rudder Braces and Ship Work in general.
☞ All Jobs promptly attended to. Prices moderate. ☜
No. 125 First street, opposite Minna, next door to Pacific Foundry.
[Removed from Oregon street, between Front and Davis.]

THE IMMIGRATION.—Some idea of the immigration across the plains the present year, says the Stockton *Independent*, may be had by knowing that the records kept at Nebraska City of the number of teams that crossed the plains at that point previous to the first of August, shows that 13,500 vehicles have passed over, averaging five animals to a team, and at least as many human beings as animals have crossed.

THE CROOK.—"My dear friends," said a returned missionary, at one of the late anniversary meetings, "let us avoid sectarian bitterness. The inhabitants of Hindostan, where I have been laboring for many years, have a proverb that, 'Though you bathe a dog's tail in oil, and bind it in splints, yet you cannot get the *crook* out of it.' Now, a man's sectarian bias is simply the crook in the dog's tail, which cannot be eradicated; and I hold that every one should be allowed to wag his own peculiarity in peace."

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The FIFTEENTH ANNUAL SESSION of this College will commence on

Monday, August 28th, 1865.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging, Washing and Mending of articles washed, School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months..... $350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignatius College, Market street, San Francisco.

3v11 REV. A. MASNATA, S. J., President.

CALL STABLE.

N. GISHWILLER

Would respectfully inform the public that he has opened a large and well arranged LIVERY STABLE,

On B street, Summit City, Cal.,

(two doors below the Lake House,) where good Saddle and Buggy Horses can be had at all times. Our charges will be reasonable, and we hope, by prompt attention, to merit a share of the public patronage. 10v11-3m

LICK HOUSE,

Corner of Montgomery and Sutter streets,

SAN FRANCISCO.

S. ALSTROM AND G. S. JOHNSON, Prop'rs.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

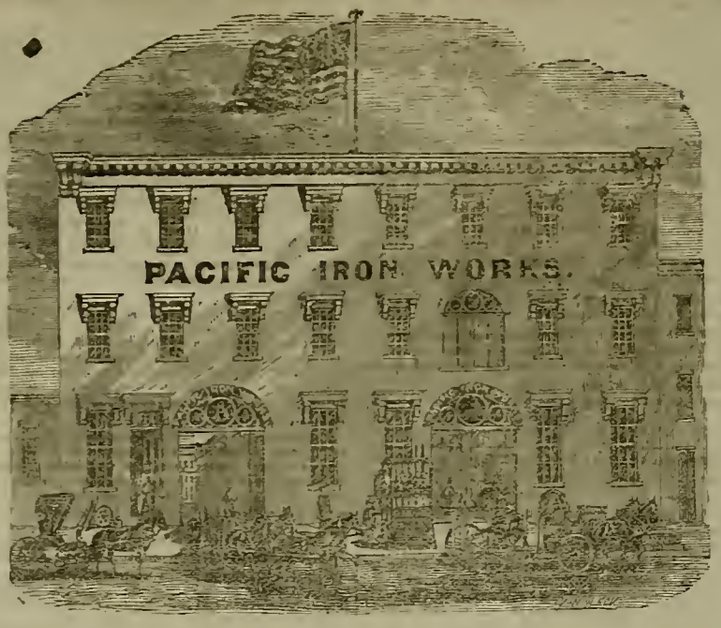
The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11-3m



THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Buttery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

And in accordance with law, and an order of the Board of Trustees, made on the 31st day of October, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at auction, at the office of the Company, by Jones & Bendixen, auctioneers, on the 1st day of December, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. nov4

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Removal.

The Office of the Mining and Scientific Press has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive Job Printing Office.

San Francisco, April 10th, 1865.

Mount Davidson Gold and Silver Mining Company, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 2d day of November, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 3d day of November, 1865, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 20th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. PARDOW, Secretary.

Office, 53 Montgomery Block, San Francisco. nov4

Simpson Mining and Milling Company, Mokelumne and Excelsior Districts, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of October, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable on the 31st day of October, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 55 Montgomery Block, City and County of San Francisco, State of California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 16th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. CUNNINGHAM, Secretary.

Office, No. 55 Montgomery Block, southeast corner of Washington and Montgomery streets, San Francisco. nov4

Table Mountain Copper Mining Company, Stanislaus District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 1st day of November, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, in San Francisco, or to J. M. Pike, Superintendent, at Copperopolis.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 18th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, No. 436 Jackson street, San Francisco, California. nov4

And in accordance with law, and an order of the Board of Trustees, made on the 19th day of September, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Doro & Co., No. 327 Montgomery street, San Francisco, on the 9th day of November, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. H. BEWLEY, Secretary.

Office, 323 Montgomery street. oc21

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,
Publishers Mining and Scientific Press.

Segregated Belcher Mining Company, Gold Hill District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of October, 1865, an assessment of four dollars per share was levied upon the capital stock of said Company, payable on the 28th day of October, 1865, in United States gold and silver coin, to the Secretary, 318 California street, City and County of San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 9th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOUSE, Secretary.

S. O. PUTNAM, Secretary.

Office, 402 Front street, San Francisco. oc21

MONEY IN GRAVES.—Workmen are engaged at St. Louis in removing bodies from the old cemetery to the new one, and in digging up the graves have found money sufficient to make the work interesting. In one grave the sum of $500 in French gold was dug up; it appeared to have been sewed up in the collar of the owner's coat, who doubtless had died of cholera, during the epidemic of 1840, and had been buried without being undressed. In another grave $150 were unearthed, and $120 in another.

A horse was poisoned to death a few days ago, in Boston, by chewing green house-paper which was lying in a barrel. He died in a few minutes.

C. T. MEADER, of Stockton, has donated twenty-eight ingots of copper, which are to be cast into a bell for one of the school houses of that city.

Deserved Testimonial.

GRIZZLY FLAT, Oct. 18, 1865.

MESSRS. HUNGERFORD & HENDY—*Gentlemen:* We have run your Concentrator for several days past, in our 5 stamp Mill, and, as far as can be ascertained at present, it is a perfect success. When running at the rate of from two hundred and ten to two hundred and twenty-five revolutions per minute, we have lost neither quicksilver nor sulphurets. Formerly, when using copperplate riffles and blankets, we found that in spite of the utmost precaution, quicksilver would escape over them all. Wishing you all success, we remain Your obedient servants,

E. A. BIGLER.
S. F. DAVIS.

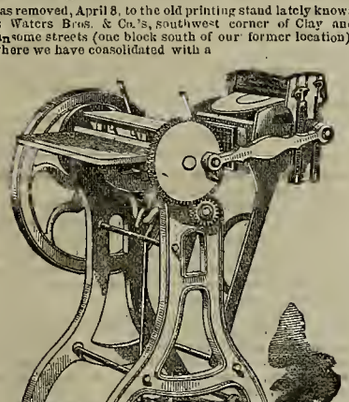
STILL PROGRESSING!

THE OFFICE OF THE

Mining and Scientific Press

was removed, April 8, to the old printing stand lately known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets (one block south of our former location), where we have consolidated with a



JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for

CHEAP, RAPID AND FINE PRINTING.

We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,
BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.

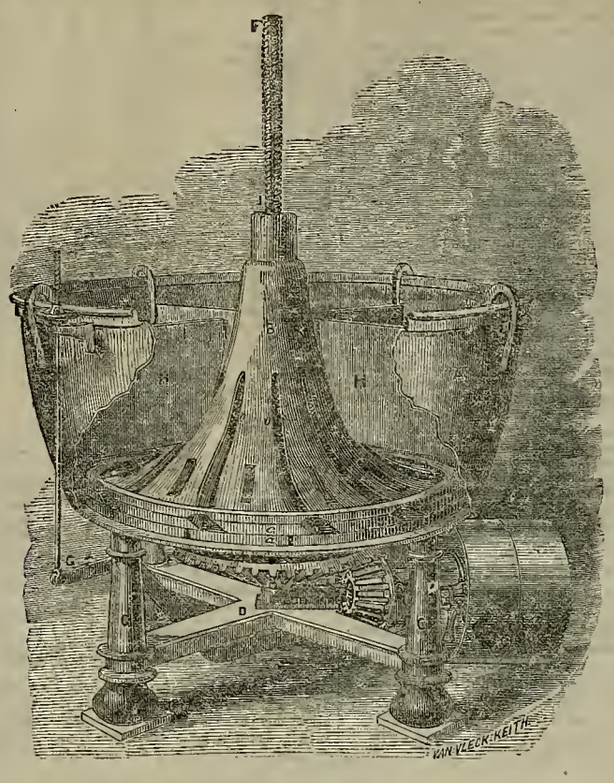
City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

E. D. WATERS, Jr., C. W. M. SMITH, } Proprietors. { W. B. EWER, A. T. HAWEY,

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINing Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.

San Francisco, Oct. 12, 1865. 15vIItf



THE EXCELSIOR

GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

20vI0-3m Pacific Coal Yard, 413 and 415 Pacific street.

BEAUTIFUL SENTIMENT.—The beautiful extract below is from the pen of Hon. George S. Hilliard:

I confess that increasing years bring with them an increasing respect for men who do not succeed in life as those words are commonly used. Heaven is said to be a place for those who have not succeeded upon earth; and it is surely true celestial graces do not best thrive and bloom in the hot blaze of worldly prosperity. Ill success sometimes arises from a superabundance of qualities in themselves good—from a conscience too sensitive, a taste too fastidious, a self-forgetfulness too romantic, a modesty too retiring. I will not go so far as to say, with a living poet, that "the world knows nothing of its greatest men," but there are forms of greatness, or at least excellence, which "die and make no sign;" there are martyrs that miss the palm but not the stake; heroes without the laurels, and conquerors without the triumph.

A GREAT CURIOSITY.—A grand landscape in mosaic has been made by a clerk in the French War Office. It is composed entirely of insects—of beetles alone there are more than 45,000, of nearly 4,000 different species, and took four years in making. The painful piece of work forms one of the chief attractions of the exhibition of insects at the Palais del'Industrie.

Machinery.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupellate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY, Engineer,**

24v9

SAVE YOUR BOILERS AND FUEL.

ONE EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

JOHN MAILER,

Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco

23v10

Rowe's Patent Æolian Refrigerator.

THIS NEW AND IMPORTANT INVENTION IS NOW offered to the public, with the fullest conviction that it will be found invaluable to the dairyman, and of most essential service in every household. By its use the amount of cream from milk may be increased nearly one-third in quantity, while for general refrigerating and ventilating purposes, it has no equal.

W. S. ROWE, Proprietor, 14v11 San Francisco.

Worth's Telegraph Reel.

MESSRS. DEWEY & Co.—Dear Sirs: I see a notice in your paper in regard to my Paper Reel, signed Henry McGann. All I have to say is, if I had invented such a Reel as his, in 1862 or 1863, and had not improved it more than he has, I would keep my name to myself, and not let the public know who I was. His modest puts me in mind of Shakspeare's play of "Much Ado About Nothing." My Reel is entirely different from his, and is considered, by operators who are judges of such things, to be the best; and as for the cord, I could rig one to my Reel that would run a week, but it is not necessary.

For the best Paper Reels, address

L. W. WORTH, Sonoma, 15v11tf Or, WM. LUNDBERG, San Francisco.

HUNTER'S PREMIUM CONCENTRATOR, AMALGAMATOR AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; no trace of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,

15v11-3m Or to E. T. STEEN, Agent.

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant st. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 864.]

ATTENTION, MINERS! LINSCOTT'S PATENT CHAMBER DRILL.

Great Improving in Blasting.

W. B. LAKE

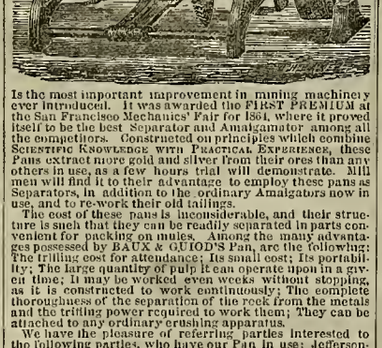
Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.

D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ¼ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

BAUX & GUIOD'S Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to rework their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

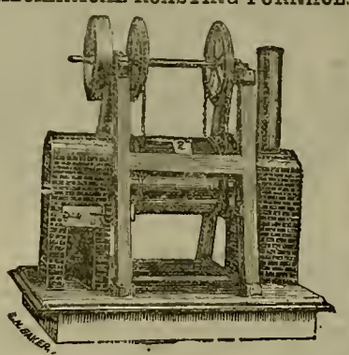
Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6tf

The Mechanics' Institute AWARDED A PREMIUM SILVER MEDAL TO BRUCKNER'S MECHANICAL ROASTING FURNACE.



Parties wishing to erect such Furnaces, are requested to leave their orders with

12v11 416 Market street, San Francisco.

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

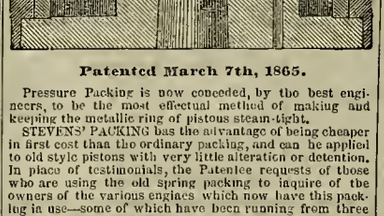
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

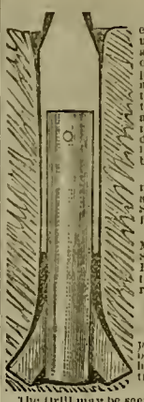
STOW'S PATENT CHAMBER DRILL.



The greatest Labor-saving Machine ever invented for Quartz Mining. By using this Drill in shafts, tunnels, and all other rock blasting, three-fourths of the labor and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 1¾ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, September, 1865, a Committee, after examining both the Linscott's and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for blasting rock, for the following reasons:

1st. For simplicity of construction;
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for **$30**, with one set of Cutters or Chisels that will chamber from 75 to 150 holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 7 Government Block, corner Sansome and Washington streets, and at No. 511 Market street.

Drills will be delivered in any part of this State free of expense to the purchaser. Any information desired, or orders for Drills, address

STOW & COLLINS,
San Francisco.

Oil Wells! Oil Wells!!

I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ¾ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to and work with any common drill at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

HENRY M. STOW,
14v11 San Francisco.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S AMERICAN DOUBLE TURBINE

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30¼. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 70 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,

At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

SALMON'S PROPELLOR AMALGAMATOR AND Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 **J. & W. C. SALMON.**

OIL WELL BORERS.

A CONTRACT WILL BE LET TO A RESPONSIBLE party to sink an Oil Well, as deep as may be required, on land belonging to the "Eel River Oil Company," situated in Humboldt county, Cal. For particulars, inquire at the office of the Company, No. 436 Jackson st., up stairs.

12v11-1m E. H. WILSON, Secretary

SUDDEN INFLUX OF WATER.—While at work in the Pike tunnel, on Union Hill, on Thursday, says the Grass Valley *Union*, the workmen, two in number, heard a distant rumbling noise, and supposing that the tunnel, which was heavily timbered, was about to cave upon them, they immediately sought safety in the open air, and skedaddled out of the tuunel. They had scarcely got out, when down came a stream of water, sufficient to have drowned a hundred men. Their presence of mind doubtless saved them from serious and perhaps fatal injury.

GOLD IN ANCIENT AND MODERN TIMES.—About the commencement of the Christian era, the annual product of gold and silver was estimated at $5,000,000; in 1492 it was only $250,000; in 1860 it had increased $285,000,000. At the commencement of the Christian era, all the gold and silver in existence was estimated at $1,326,000,000, and in 1863, it was estimated at $10,562,000,000. The whole amount of gold and silver obtained from the earth from the earliest periods to the present time, is estimated at $21,272,000,000.

A LARGE meeting of mechanics was held at Norwich, Conn., September 23d, for the purpose of taking steps to reduce the hours of labor from ten to eight hours a day. It was agreed to make the subject a test question with candidates for public office, and by that means get the desired change by legislative action.

QUARTZ OPERATOR'S HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.
BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, concisencss, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postag paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco," 2v11

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and Loudon.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertainiug, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distiuguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

HELMBOLD'S
FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S
FLUID EXTRACT BUCHU
AND
Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure;* completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury,* in curing these diseases.

H

USE HEMBOLD'S
FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu
IS THE GREAT DIURETIC.

L

HELMBOLD'S
HIGHLY CONCENTRATED
Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

WHITE'S PATENT FOR CALCINING ORES.

One of the most difficult processes connected with mining, is that of desulphurizing or disintegrating the pyritnous ores. This has usually been accomplished in what are known as reverberatory furnaces, where the pulverized ores are placed upon a large flat hearth or floor, over which a flame is caused to pass, by which the ores are raised to the required degree of heat. The great labor, however, of stirring the ores, which must be done at very frequent intervals, in order to bring new surfaces to the oxydizing flame, has been found quite too expensive and slow an operation, especially for California. Hence various new devices have been brought out, the chief and most promising of which appears to be the principle of the rotary cylinder furnace—several different patents for which have been taken out during the last three or four years.

Rotary hearths, with automatic stirrers, were tried many years ago in England, and, if we mistake not, a rude description of a rotary furnace was also tried there; but all attempts at innovation on the old reverberatory hearth were finally abandoned. It was not until the high price of labor in California and Nevada demonstrated the absolute necessity of the introduction of some cheaper process of desulphurizing, that the inventive genius of American mechanics was set actively to work in this direction. The result in this instance, as in all other similar cases where an important and definite end was to be accomplished, has been a success; and at this time there are very few practical miners who are not satisfied that the reverberatory hearth must soon be entirely disused for roasting ores. The rotary furnace may not yet have reached perfection; but we have already contrivances upon that principle which are certainly practicable, and which will reduce the expense of roasting ores to a very small cost.

We have already, in previous numbers, described several devices for automatic roasting, and we now present our readers with the annexed representation of one invented by Mr. White, of New York, and which has been put into successful operation there upon ores from Colorado and California. The apparatus consists of a furnace and an inclined rotating cylinder, the outside of which is supported by boiler iron, the inside being built up of fire brick, so as to leave one central or fire flue, surrounded by six ore flues, as shown by cross section in fig. 5. In these latter the ore or other substance to be calcined is subjected to the action of heat from a furnace. The principal points in which it differs from other apparatus consisting of such a furnace and cylinder are, 1st, in having separate flues or passages for the gases of combustion, and for the ore to be calcined, so that the ore is not exposed to contact with the gases; 2d, in having the furnace located at the opposite end of the cylinder to that at which the ore enters, so that the ore may be subjected to a gradually increasing heat as the calcining progresses; 3d, in having the calcining-flues so combined with the furnace that the gases eliminated from the ore, in the calcining process, may enter into combustion in the furnace, and thereby save fuel. There are also some minor points of difference.

Fig. 4 gives a sectional view of the interior of the cylinder, furnace and smoke stack, showing the arrangement of the feed, receiving tank, etc.

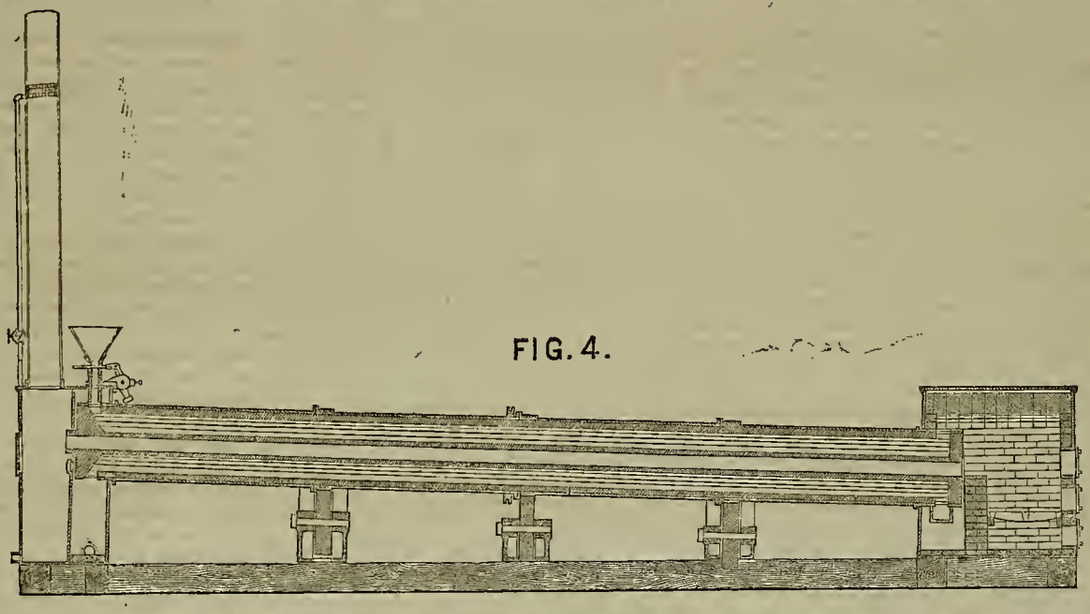

FIG. 4.

Fig. 5 gives a cross section of the cylinder, showing an end view of the central or fire flue, and the six surrounding ore chambers or flues, exhibiting, by the mode of their construction how, by their revolution the ore is made to fall across the diameter of each separate flue, thus coming in contact with the oxydizing influence of the heated air. The position of the anti-friction wheels or rollers upon which the cylinder rests, is also shown in this figure.

The operation of the furnace is as follows: The ores are fed into the hopper, as shown in fig. 4, and of the fineness of coarse Indian meal. The cylinder revolves about twenty times per minute; and six times during each revolution cams on the cylinder open the hopper, and let about a pint into it; the ore, falling through the flames into the groove at the bottom, is carried up by the rotation of the cylinder, and when at the top is again dropped through the flames; this process goes on incessantly, and the ore, by means of the inclination of the cylinder, is slowly carried to the discharging end by its own gravitation, where it falls into a receiving-chamber, or a tank of water, if preferred.

The fire from the furnace is driven into and through the central or fire cylinder by the ordinary draft. When the machine is to be started, the fire is built and continued without any charge of ore, until the entire interior brick-work of the furnace has arrived at a proper degree of heat for roasting. The cylinder is then set to revolving by means of chain pulleys, about one-half of a horse power being required for that purpose, for a cylinder 24 feet long by 30 inches diameter, and which is said to be capable of calcining 24 tons each twenty-four hours. As soon as the cylinder is in position, the feed is turned on, as already described, and the process of desulphurizing immediately commences. The fumes from the ore flues pass out into the furnace, from whence they are taken by the draft into the fire flue, where those that are consumable are summarily disposed of as aids to combustion.

In fig. 4 will be seen a triple coil of pipe inside and near the top of the chimney; this is perforated with numerous small holes, through which jets of cold water are ejected in every direction. When the heated air, in ascending the chimney, comes in contact with this water, a thick cold vapor or mist is formed, which precipitates into a tank below any portion of the precious metals which may be held either in mechanical separation, or in a state of vaporization. As the machine is constantly revolving about twenty times per minute, every atom of ore is in constant motion; and, it is calculated, is sifted or showered through the fire or flames 400 times during its passage through the cylinder.

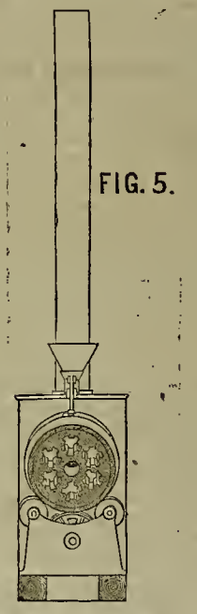

FIG. 5.

The calcined ore is shoveled out from the further end of the receiving-tank; and, according to the statements of the inventor, so thoroughly is it disintegrated that it can rapidly be mulled into an impalpable powder by the simplest means; quicksilver then added will immediately take up all the gold and silver.

This machine, the inventor assures us, has already had a thoroughly practical trial in New York. He is now here to prove its usefulness to the miners of California, and is desirous of connecting himself with some capitalist, who will advance the necessary amount of funds for doing so. It is undoubtedly well worthy the attention of the mining public.

Rich Specimens from Idaho.—We were shown some very rich and rare specimens of gold and silver bearing rock, a few days since, by Dr. J. C. Hawthorne, of Idaho. The Doctor left on the steamer yesterday, for the East, whither he goes to interest capitalists in the development of some of the rich mines in his section of the country. Judging from the indications set forth in an article on page 294, we presume the Doctor will not have to labor very hard to satisfy capitalists at the East that we have as rich mines in Oregon and Idaho as can be found in any part of the world.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Hints about Working Copper Ores.

Editors Mining and Scientific Press:—I see your correspondents are agitating the subject of copper reducing, by smelting, and concentrating by water. It is a matter of much importance to our State, and a little light may be thrown upon it, by each contributing his mite. Mr. Mosheimer advocates concentration by water. In some cases it may be the best way of treating ores; but in most I believe it will be useless. Before we go farther, we must inquire what kind of ores can be concentrated, and what cannot:

1st. Ores that contain pyrites of a high grade (that is, but little sulphur and iron), and which are so mixed with gangue rock that they assay low, may be bettered by concentration.

2d. Ores containing purple and grey sulphurets, intermixed with pyrites, or such as are like the Lake Superior ores, containing native copper.

The gangue also has great influence upon concentration; slate, or sandstones are easily separated; lime, or magnesian stones, are more difficult. Those which cannot be profitably concentrated, are pyrites containing much iron and sulphur.

The ores of this vicinity are a good example of this class. The Campo Seco mine has at least 15,000 tons of ore in sight, assaying from nine to twelve per cent. There is scarcely any gangue; but wholly iron, sulphur, and copper.

If Mr. Mosheimer would look into the matter, he would find many of the best mines in the State of this character; their No. 1 ores assaying eighteen to twenty per cent. If he would take a piece of the best Keystone ore, and assay it, he would find it only twenty-five per cent. How he could take the low grades from this mine and concentrate them to twenty-five per cent., is a mystery to me.

The gentleman tells us that the English and German metallurgists find concentration cheaper than smelting; but he should also have told us that the ores they concentrate are very low—from one to five per cent.; and if the smelting works are not too distant, they consider it cheaper to smelt ores of seven per cent. than to concentrate farther.

I have seen ores concentrated in Canada. The cost there was about two dollars per ton. The ore, as it came from the mine, would assay from two to three per cent. The concentrated ore was usually of three grades, viz: 20 per cent., 14 and 7; with a loss of one-fifth of the per cent by the operation.

The advantages in their favor were an abundance of clear water and cheap labor; the best hands getting from seventy-five cents to one dollar per day, and boys fifty cents. The ore was a high grade sulphuret, containing but little iron and sulphur, and mixed with purple and grey ore.

We in California have none of these items in our favor; at least not in Calaveras, or the adjoining county of Amador. Water, such as is necessary for concentration is scarce and high; labor high, and the ores not the right class.

The Campo Seco mine has tried *kernel roasting*, with only partial success. The ores by this process are treated in the following manner: They are first piled in the same way as for roasting, preparatory to smelting, only they are not covered so closely with fine ore. They should burn three months. The sulphur distills from the lumps, and the copper concentrates to the center, leaving the iron oxidized upon the surface. This oxide is easily knocked off, leaving a kernel of sulphide of copper, of a much higher per cent.; nine and ten per cent. ore giving seventeen per cent. kernel. The main objections to this process is the cost of assorting the kernels, and the care it takes to perform the operation properly.

The only practical way of treating our ores that I know of, is smelting once, to make matte of forty or forty-five per cent., and then shipping. The process of making copper is too complicated for this country at present. It requires too much capital, fuel, and labor, and too great a variety of ores for any one locality in the State. When we have cheap transportation, and suitable coal, the business may be carried on successfully at some point near San Francisco.

There are, no doubt, great obstacles in the way of even smelting once for matte. But we must recollect that ten per cent. ores are worthless to ship; although in many cases they are so intermixed with good ore that they must be taken out in order to get any shipping ore. Of course, the mine owners will dispose of such ores at a low price. Ore of this description is worth in the Atlantic States $3.50, for unit of copper; here it can be bought for one dollar. Does this not leave a large margin for the smelter?

I will not attempt to give any estimate of the cost of smelting. It has been done by a much more able person (Dr. DeHierry) in your columns.

I think when you compare the value of forty-five per cent. matte, in the Atlantic States or Europe, with twenty and fourteen per cent. concentrated ore, and recollect that there is a loss of one-fifth by the most skillful manipulation, and one-third more in low per cent. ore not worth shipping, you will see a large balance in favor of smelting.

W. B. West.

Campo Seco, Calaveras.

[Written for the Mining and Scientific Press.]

Mining in Grass Valley.

Editors Mining and Scientific Press:—There is always something new turning up in this locality that interests the miner; new strikes are being made almost every day which astouish the oldest inhabitants of this section. Mother Earth is yielding up her treasures to the honest miner with liberal hands, as she always will do when sought after in a legitimate manner. I would like to keep you posted with regard to mining interests in this locality by a letter every week; but my labors are such as to require nearly twelve hours of the day to attend to our work, and most of that time under ground, enveloped in a cloud of powder smoke; hence, I do not feel like scribbling much. I see you clip an item once in a while from the *National* and *Union* about our mines. It seems strange to me that the editors of those journals, who profess to be so zealously anxious to build up the interests of this locality, do not come out and visit our mines, with the view of giving more full and faithful reports of the same. We seldom hear of their being down a mine; hence, it is supposed that they pick up such items as may chance to find their way to the streets, banking-houses, or express offices, where they visit, taking it for granted that it *must* be true that John Doe or Richard Roe has struck it rich. Come out, gentlemen, "*don the miner's duds*," and every superintendent in the vicinity will take pleasure in putting you through the mine, and you will *see* and *hear understandingly* of how our mines are being worked.

Tom Findly & Co. have opened their Union Hill mine with very flattering prospects; their ledge looks well. Of course nothing positive as to a permanent paying mine has been arrived at, as they have not had time to open the mine thoroughly. We may speak more positively of the mine in about six months from now. The Spring Hill mine is in course of being thoroughly opened; the incline is down 150 feet on the course of the ledge; the ledge varies from two to six feet thick; nothing definite as to the quality of the rock, they not having crushed any as yet; but judging from appearances, it ought to pay. We are satisfied that if Capt. Day can find rock that pays $12 per ton, he will make it a handsome paying mine. The Captain deserves great credit for the work he has put up on the mine; there is none equal to it in this vicinity. The machinery is compact, useful, and durable. We understand that about 200 tons of ore has been taken out, which is to be crushed at the Gold Hill and Sebastopol mills. The result of the crushing will be no positive proof of the mine however; but when the Captain has sunk three or four hundred feet, and extended his drifts about the same distance, he may count upon something positive. We wish him success, and every other man of his stamp.

We have been looking for something to turn up in the Coe mine beside defective machinery and bad management, but neither see nor hear of any improvement as yet. We have been told by the miners working under ground that the vein is large, and shows considerable fine gold, and we *never* doubt an *honest miner!*

The Eureka mine continues to yield handsomely. This mine, as you have already told the public, has been sold. The Watt Bros. will, undoubtedly, make a better paying mine of it than the "Emperor" did, by reason of their superior judgment as mine managers; but the Emperor has realized quite a fortune out of it.

The Seadden mine is yielding handsomely, from the rock taken out of the main shaft in course of sinking. We regret to see the work of opening the mine in depth delayed for the want of machinery, as we cannot class the present works there as machinery at all; it is a useless expenditure of money. We have never seen so gross an oversight displayed by men who have practical experience; but we suppose a dollar looks as large to them as a coach-wheel.

In my letters, heretofore, I have omitted speaking of the Ophir mine; not that it was less deserving, but because the prospects of the mine were such, that, notwithstanding they warranted a first-class mine, it is only recently that they have been sufficiently developed to admit of my speaking with any degree of certainty. In spite of the predictions of all the wise men of this district to the contrary, those prospects have now revealed a splendid mine, and it is amusing to hear those who condemned the Ophir formerly, say that they always said and advised the old Empire company to prosecute their work on the south ground, which is to-day the most productive. We doubt very much if another man could be found in this county who would have persevered half as long as Captain Lee, with the disadvantages he had to contend with in developing the mine. The Captain was a perfect stranger to the place, and the material he had to rely upon for information in opening the old mine was none of the best; yet, he never despaired as long as there was a "shot in the locker." Even when the Linscott patent drill could make no impression on the rock, the Captain, seasoned with a good temper, broke through the crust, and is now rewarded with an A 1 mine. Such is almost invariably the reward of men who are determined to give any enterprise a fair trial, with their energies directed in a legitimate manner. We believe about $20,000 had been spent before a ton of ore had been extracted that paid anything over expenses. This mine is owned by Captain Lee and Mr. Houston of your city. Captain Lee is the managing agent. The mine is worked through an incline shaft 550 feet long, at an average angle of 35°; the bottom level is run 450 feet, going through a fine body of ore ground for 350 feet long, averaging three feet thick. The hight of bucks at present is 350 feet. As the level is extended the bucks become higher, until solid ore ground to surface is reached. The average yield of ore per day is forty-five tons, working sixteen pairs of men; average yield per ton $35. The company have only six head of stamps, which crush about sixty-five tons per week. There are about 1,500 tons of ore on the surface. With the present prospects the mine is destined to become one of the leading mines of this county. We have never seen a finer lode of ore in any mine here. The company is sinking a new incline shaft 11½ feet, by 5½ feet high, with three compartments—two for hoisting and one for the pump and foot-way. On this shaft is being erected one of Colliss's engines, 12 inch cylinder, 24-inch stock; boiler 15 feet long, by 45 inches in diameter, with 4-feet steam drum. This engine will hoist and pump. There are to be two hoisting reels six feet in diameter, working separately and independently. The work on this engine will be completed some time next month, every thing being done in the strongest and most approved manner. The new shaft will, no doubt, be connected with the bottom, south level, in about four months, when the mine will just then be considered in a fair way of development. With proper management, 100 tons will then be little enough to calculate on as the regular day's hoisting. In view of this, and the accumulating ores on surface, there is a new mill, of thirty stamps, being erected. The engine to run this mill is 150-horse power, 18-inch cylinder, 42-inch stroke, two tubular boilers 16 feet long, 54 inches in diameter, with large steam drums, fly-wheel to weigh seven tons. The stamps will be 750 pounds each, ten pans, and three large amalgamators, of the most approved make, will be put up. Messrs. Baux & Guiod have erected one of their pans in the old mill, at their own expense, in order to test its capabilities. It has run about a week, and seems to be just the pan for the work. No doubt the company will give all the different styles of pans a test, so as to arrive at the best. The whole cost of the work now being erected on the Ophir mill will, undoubtedly, reach $75,000. The machinery for the mill is being got up at the Vulcan Foundry in your city. We hope to give you a fair description of the mill as soon as erected, which will be in about five months.

The Redan mining company, incorporated in your city for the working of some mining ground here, have not been as successful as we could wish them—we hear of their suspending work for awhile. The company should not be discouraged; they should understand that the ground they purchased was not warranted paying ground, from the fact that they only paid about $4,000 for it. It was only a prospect, and nothing more, and, still remains so, as they have only commenced to develop the lode. I am satisfied that Mr. Eudy, their mine manager, who has no superior in this county as a practical miner, will find a mine there, if it is to be found in this ground, and at the least possible expense.

I am sorry to say that the Osborne Hill mine is idle, but whether for want of brains or capital to work it, I know not; but there is no more deserving mine in this township. It has, unfortunately, been in the hands of inexperienced mine managers. I have heard some of our miners pronounce it a pity that this mine had failed to pay; because its success would have had a great influence upon capitalists who intended to invest in our mines. We hope all such capitalists who know no more of the business of mining than those who last undertook to work the Osborne Hill mine, will keep out of Grass Valley, for they would certainly fail in making the best mine in our township pay.

I understand the Bordette mine, owned by parties in New York, is looking favorable. It is to be hoped that the mine will prove good, for the reputation of our town is, in a measure, at stake on its success. Mr. Fisher is the superintendent who was sent here from New York. I am not acquainted with the gentleman, and consequently do not know whether he is a miner or not. He seems to be a stirring little fellow, however, and I hope he will strike a three-feet lode, which he says he can make make pay at $20 per ton. If he can't make a smaller lode pay at less rates, he will not be a very successful manager in this township.

Grass Valley.

Grass Valley, Oct. 11, 1865.

[Written for the Mining and Scientific Press.]

Mill Valley District, Calaveras County.

Messrs. Editors:—A few days ago, in company with a gentleman from your city, I visited the diggings and mines of this thrifty little mining camp, walking up steep hills, down steeper gulches, and pulling ourselves through chaparral, which was as thick as an Indian jungle, until my friend from San Francisco thought he felt an earthquake, which was nothing more than a cave in the inner man. We finally returned home, satisfied that we had seen enough of the slide for one day, but did not discover the whisky.

The placer diggings are now without water, so there is little doing in them; the chief business, therefore, is quartz mining, which bids fair to become a permanent thing and a paying institution, judging from the prospect already obtained.

The first quartz claim we examined is known as the Whisky Slide lead, which is divided into fifteen shares, of 200 feet each, so that the company own 3,000 feet on the lead; they also own 2,800 feet in the School House lead, which is close by. They have on the Whisky Slide, 600 feet from the shaft, a small 5-stamp steam prospecting mill, 8-horse power, which has been running since the 15th of September last. They are now about erecting a 15-stamp steam mill on the site of the present one.

I descended the shaft, an incline now seventy-three feet deep, and five by seven feet in the clear. I found the vein about five feet wide, much broken and disturbed throughout the entire depth of the shaft. It is, however, well defined, having distinct walls, and pitching east at an angle of thirty degrees.

The rock already crushed has paid ten dollars per ton; they had just cleaned up a run of 48 tons as we got there, and therefore we did not see the mill at work. The parties putting up the mill get half the lead for so doing, and from present appearances they have made a good trade.

Next adjoining is the French claim, ten shares, or 2,000 feet. This claim is the oldest in the district, having been opened in 1857 by Partroon, Herman & Company, merchants of Esperanza, who, having found some good rock near the surface, were encouraged to go on prospecting. However, as they had no knowledge themselves of mining, they chose parties to do the work who they knew to be good laborers, thinking, of course, that was all sufficient, but after several months they found themselves minus two thousand dollars, and their lead apparently worthless—the inevitable consequence of unskilled labor in mining. It has remained idle since then, until within a few weeks ago, when Mr. E. Wallace, an old

miner of the district, re-discovered that which the Frenchmen lost—the true vein—and has since sunk a shaft on the incline thirty feet, and is taking rock equally as good as that taken from the Whisky Slide, and which it closely resembles. I think I may safely say that the parties now in possession of this lead will test it thoroughly before it is again abandoned. I did not go down this shaft, but I saw some of the rock, which showed free gold in considerable quantity, and judging from this and external appearances, I think they have a good lead, and that the Frenchmen, who are again interested, will get back their money so foolishly expended in 1857.

There are several other claims now being prospected here, but those mentioned are the only ones sufficiently opened to form an opinion as to their probable value, and I will therefore await further developments before I speak of them.

I hear of two valuable mechanical inventions having been made by a mechanic of this district, and am promised a description of them for the PRESS. R. W. D.

Whisky Slide, Calaveras Co., Oct. 23.

INTERESTING GEOGRAPHICAL FACT, IF TRUE. The London *Shipping Gazette* says, the discovery has been made in Paris that in the maps of the last century two small islands were indicated between Ireland and Newfoundland—one called by the French Isle de Verde, at about latitude 27° north and longitude 29° west from Paris; the other called Isle Jacquet, latitude 47° north and longitude 42° west. In the maps of the present century these islands are not marked; but it is thought probable by the French that they still exist. If so, they could be utilized in the laying down of the electric cable.

There is no especial improbability in this statement. A hundred years ago the paths of ships upon the ocean were exceedingly devious. The currents and prevailing winds were then very little known. Recent discoveries and scientific research have introduced a class of information and facts to the navigator, by which he is enabled greatly to shorten the distances of his voyages—the curvature of the earth now enters largely into the calculation of the course, even between Europe and America. A century ago, if an observer had been placed at an elevation where he could have had one of the great oceans spread out before him, and within the reach of his vision, he would have seen the ships of commerce scattered over almost every portion of the same, with very little regard to any uniformity of direction, even in vessels moving from the same port and bound to a common haven. Now, were an observer so stationed, the ships moving on the the same voyages would appear to be traveling in almost uniform lines. "Great ocean highways" are now literal facts; and the shipping of the world is confined almost as closely to given highways, as the overland stages which cross the continent of America, or wend their way from Russia, as they do, across the continent of Asia to the head-waters of the Amoor river.

The islands alluded to by the *Shipping Gazette*, are located off from the usual track of shipping, and would now be seen only by a vessel out of her course, or on an especial exploring expedition. It is quite probable that the old geographers were right in placing them where they did; and that the fact of their being uninhabited, out of the usual track, and of no commercial importance, induced later geographers to drop them from their maps and charts altogether. Should their existence be proven, they would certainly be of great importance in establishing telegraphic connection between Europe and America.

TENACITY OF LIFE IN SHARKS.—Some fishermen in the bay recently hooked a shark of enormous size, estimated at from 800 to 2,000 lbs. Finding it impossible to get him into the boat, they ripped him open with their knives, and took out his liver, which was a mass of fat, filling a Sandwich Island sugar keg, nearly the size of a barrel, and then cut him loose. After being let loose the mutilated shark swam around and splashed vigorously in the water for some minutes. The liver was subsequently exhibited in the fish market on Clay street.

ENLARGED.—The Oakland *News* comes to us greatly enlarged, and in a completely new dress. We are pleased to note this evidence of prosperity in our neighboring contemporary

Useful Information.

Chinese Mode of Taking Honey.

Mr. Fortune, the well-known English botanist, thus describes the mode adopted by the Chinese for taking honey from bee-hives. He says: "The Chinese hive is a very rude affair, and looks very different from what we are accustomed to use in England; yet, I suspect, were the bees consulted in this matter, they would prefer the Chinese to ours. It consists of a rough box, sometimes square and sometimes cylindrical, with a moveable top and bottom. When the bees are put into a hive of this description it is rarely placed on or near the ground, as with us, but is raised eight or ten feet, and generally fixed under a projecting roof of a house or outbuilding. No doubt the Chinese have remarked the partiality which the insects have for places of this kind, when they choose quarters for themselves, and have taken a lesson from this circumstance. My landlord, who had a number of hives, having determined one day to take some honey from two of them, a half-witted priest, who was famous for his powers in such matters, was sent for to perform the operation. This man, in addition to his priestly duties, had charge of the buffaloes which were kept on the farm attached to the temple. He came round in high glee, evidently considering his qualification of no ordinary kind for the operation he was about to perform. Curious to witness his method of proceeding with the business, I left some work with which I was busy, and followed him and the other priests and servants of the establishment to the place where the hives were fixed. The form of the hive in this instance, was cylindrical; each was about three feet in length, and rather wider at the bottom than the top. When we reached the spot where the hives were placed, our operator jumped upon a table there for the purpose, and gently lifted one of the hives and placed it on its side on the table. He then took the moveable top off, and the honeycomb, with which the hive was quite full, was exposed to our view. In the meantime an old priest, having brought a large basin, and everything being ready, our friend commenced to cut out the honeycomb with a knife apparently made for the purpose, and having the handle almost at right angles with the blade. Having taken out about one-third of the contents of the hive the top was put on again, and the hive elevated to its former position. The same operation was repeated with the second hive, and in a manner quite satisfactory. But, it may be asked, 'Where were the bees at this time?' and that is the most curious part of my story. They had not been killed by the fumes of brimstone, for it is contrary to the doctrine of the Buddhist creed to take animal life; nor had they been stupefied with fungus, which is sometimes done at home; but they were flying about over our heads in great numbers, and yet although we were not protected in the slightest degree, not one of us was stung; and this was the more remarkable as the bodies of the operator and servants were completely naked from the middle upwards. The charm was a simple one; it lay in a few dry stems and leaves of a species of Artemesia, (wormwood,) which grows wild on these hills, and which is largely used to drive that pest, mosquito, out of the dwellings of the people. This plant is cut early in the summer, sun-dried, then twisted into bands, and it is ready for use. At the commencement of the operation which I am describing, one of the bands was ignited, and kept burning slowly as the work went on. The poor bees did not seem to know what to make of it. They were perfectly good-tempered, and kept hovering about our heads, but apparently incapable of doing us the slightest injury. When the hives were properly fixed the charm was put out, and my host and his servants carried off the honey in triumph."

MAPPING THE MOON.—At a late meeting of the British Association for the advancement of science, a report was read from the Lunar Committee, charged with the duty of preparing a large and accurate map of the moon's surface. Mr. Birt, Secretary of the Committee, describing the plan of the work, said it was proposed to divide the moon into four quarters, and then sub-divide it into divisions of twenty-five degrees of latitude and longitude. The work has occupied the attention of the association for thirteen years, and every crater, mountain, and plain which has been the subject of examination, has been designated by a symbol; and numerous micrometrical measurements have been included which are now undergoing re-examination, reduction, and classification. The proposed map will be seventy-five inches in diameter.

COLORED POPULATION.—In the eight principal counties represented at their Convention, there is a population of 3,424. They have eleven churches, eight schools, and own property worth $1,500,000.

The Origin of Cotton.

The great staple, on which so much of commercial stability and physical comfort depends, has a remote origin, and we are dependent for it as for many other articles, upon the East. Professor Draper's new book furnishes this information:

"To the Saracens we are indebted for the cotton manufacture. Through their influence that art was extended from Japan to the Gulf of Guinea, from the Pyrenees to the equinoctial line. They spread the use of that material which at this day constitutes a chief source of the wealth of manufacturing Europe and agricultural America—mathematics, astronomy, chemistry, etc—they have left an indelible impression, of which such words as algebra, alcohol, and many others that might be mentioned, are the enduring reminiscences, so in this branch of industry they are like witnesses; not a few of its terms that have been incorporated in our speech are of Oriental origin. The word cotton itself is Arabic; muslin is so called from Mosul, a city on the banks of the Tigris, once the chief seat of its manufacture; calico, from Calicut, in India. The under-garment worn by ladies passes under a name which shows from whom they derive it, for chemise is an Arabic word.

The cotton manufacture was commenced in Spain by Abderahman III. A. D. 930, a period during which attention seems to have been particularly directed by the Moors to the improvement of agriculture and manufactures, while the rest of Europe was falling deeper and deeper into barbarism and night. The Khalif introduced into the peninsula the sugar-cane, rice and the mulberry tree, with many improvements in such arts as tanning and the manufacture of silk. Cotton was carried into Sicily by the Saracens on their occupancy of that island, and indeed from Spain the use of it spread more or less all over the north and east of Europe. One of the Mohammedan applications of this vegetable product was destined to be of the utmost value; it was the invention of cotton paper. The real merit of the invention of the art of printing lies, not as is commonly supposed in the contrivance of the press and types but in the making of paper. The process of multiplying impressions by seals and stamps, which is essentially a printing process, had been known from the remotest antiquity; but such operations could never be made available for the extensive dissemination of knowledge until something more abundant and cheaper than papyrus and parchment was discovered. This want was supplied by the Arabian cotton paper.

HOW TO ENTER UPON A SCIENTIFIC PURSUIT. In entering upon any scientific pursuit, one of the student's first endeavors ought to be to prepare the mind for the reception of truth, by dismissing, or at least lessening his hold on, all such crude and hastily adopted notions respecting the objects and relations he is about to examine as may tend to embarrass or mislead him; and to strengthen himself by something of an effort and a resolve for the unprejudiced admission of any conclusion which shall appear to be supported by careful observation and logical argument, even should it prove of a nature adverse to notions he may previously have formed for himself, or taken up, without examination, on the credit of others. Such an effort is, in fact, a commencement of that intellectual discipline which forms one of the most important ends of all science. It is the first movement of approach towards that state of mental purity which alone can fit us for a full and steady perception of moral beauty as well as physical adaptation. It is the "euphrasy and rue" with which we must "purge our sight" before we can receive and contemplate as they are the lineaments of truth and nature.—*Sir John Herschel.*

HEART AND BRAIN.—In some of the lowest types no trace of a nervous mechanism can be discovered. A little higher in the scale of organism it is very slight and simple. Still higher it becomes complex and important. It culminates in man. Corresponding with this scale of complexity in the sensitive life is the scale of complexity in the nutritive life. As the two rise in importance they rise in the scale of dependence. A frog or a triton will live long after its brain is removed. Frogs have been kept for several weeks without their brains, and tritons without their heads. Redi, the illustrious Italian naturalist, kept a turtle alive five months after the removal of its brain. A somewhat similar parallelism is seen on the removal of the heart. None of the higher animals can survive a serious injury to the heart; but that organ may be removed from a reptile, and the animal will crawl seemingly as lively as ever. A frog will live several hours without a heart, and will hop, swim and struggle as if uninjured. Stilling once removed all the viscera from a frog, which, however, continued for one hour to hop, defend itself, and in various ways manifest its vivacity.

HOW TO SAVE THE DROWNING.—If you have any distance to swim, the wisest plan is to undress, which can be done in a few seconds. You then have more freedom of limb, and can rush through the water with speed and alacrity. And if the drowning person should succeed in clutching you, your chances of freeing yourself, being naked, are immeasurable compared with what they would have been had you been hampered with your wet clothing. When you approach the drowning, watch diligently an opportunity, and seize him by the back of the arm, below the shoulder. You will in that position be enabled to keep him at arm's length before you, and exercise the most perfect control over his and your own movements. His face being from you, the temptation to grapple with you is removed, and you have more facility to make to the shore or most convenient place of landing. Never attempt to seize a drowning man by the hair of the head. There is great danger to be apprehended in so doing, for, as the arms are at liberty, you are liable to be caught in a death-grip in a moment.

The Geology of the Yosemite Valley.

Gov. Bross in one of his letters throws out the following suggestion as the probable origin of the famous Yosemite Valley and Falls:

Our readers who are at all acquainted with the principles of geology, will ask themselves how this valley, averaging about a mile wide, and whose granite walls are from three quarters to a mile and a quarter high, was formed. Here is a theory, based upon such facts as we were able to observe, which each reader is desired to take only for what it is worth. In the early history of our planet, after the Sierra Nevada mountains were formed, from some change in the central and fused portions of the earth, there was an upheaval, far down beneath the present valley, which, of course, would break the mountains asunder. It would require but a slight elevation twenty miles below to make a fissure a mile wide at the surface. The debris formed from rending the mountains apart at first fell down far into the fissure, and were subsequently covered up by the sand and gravel brought down by the tremendous currents and glaciers which swept through the valley. This is proved by the fact that at Tu-toch-a-luna (three-fourths of a mile high), and other perpendicular walls where the fracture corresponds with the cleavage of the granite, and where it is especially solid, there are no boulders at their base, and you can ride up directly to them and put your hand upon the crag, while to look up to the summit makes you dizzy and bewildered.

At other points, as in the rear of Mr. Hutchins' house, and at the Yosemite Falls the upper portions of the mountains have been thrown off after the lower sections of the valley were filled with sand and gravel, as before stated, and for a long distance from the base of the mountains tremendous boulders of granite lie piled upon each other in the wildest confusion. Their edges are sharp, and as there is no debris between them, it is certain that they were broken off and fell down long after the valley was formed. With a field glass, and even with the naked eye, large white seams of what we suppose to be feldspar can be seen in the granite walls, and we doubt not that photographs carefully taken of opposite bluffs will show a general if not an exact correspondence in the rise and general direction of these seams. Then again the opposite sections of the valley seem to be nearly of the same height, especially where the granite is solid and the walls unbroken by the elements or other causes. The entire valley will long be a favorite resort of geologists as well as those who admire the beautiful and the sublime handiwork of that Almighty Being who made and adorned this most wonderful valley.

A CAMEL ON THE TRACK.—The locomotive taking a train of cars from Sacramento to Colfax, on Friday of last week, while passing through a deep cut in the mountains, just beyond Newcastle, encountered and knocked from the track a camel. The camel was not seriously injured, but who it belonged to, or where he came from, was unknown to the residents of that neighborhood. The engineer thinks he shall hereafter keep a sharp look-out for an "elephant."

QUINEY HALL CLOTHING.—Messrs. Davis & Schafer, proprietors of the Quiney Hall Clothing Emporium, at No. 545 Washington street, are now exhibiting to their numerous customers a most magnificent assortment of ready-made clothing and furnishing goods, embracing every variety of good quality and desirable style.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 11th, 1865.

Within the past two or three weeks there has been a steady increase in the demaad for money, with a larger amount of good business paper and satisfactory collaterals offering. The inquiry seems to have been confined to no particular department of business; all interests having sbared in some degree. The ordinary rate of discount in bank is now 1¼ ₱ cent. per month, and a number of negotiations have been made this week at 1½ ₱ cent. Outside loans rule at 1½@2 ₱ cent., according to the character of the collateral offering.

The receipts of Treasure from Domestic sources, since our last reference, amounted to $1,080,000, nearly all of which came from the nortbern mines of this State, and from Nevada.

Bullion has been in active request throughout the week, and sales of gold bars were made for the steamer of yesterday at 850@860, with some transactions at even higher figures. Silver is unchanged, and is quotable at par to ¼ ₱ cent. premium.

Legal Tenders have been rather more active, but at a slight decline, and considerable sales were made within a range of 69½@68½c, closing at 68¾c bid. Our latest telegraphic advices from the East quote gold at 147.

There has been some improvemeat in nearly all shares, and the aggregate trausactions show a large increase over last week. A number of seller's-option coutracts have been filled, and it is thought that some important orders have been executed, with a view to a better market. Advices from different mines appear to be regarded with much more favor, aad if all stocks were not now in such apparent discredit with the public generally, and certain capitalists in this city would afford the usual facilities to dealers, an early and substaatial recovery to the market might be confidently looked for.

Gould & Curry has been in more favor, aad 20 feet were dealt in, advanciug from $1,025 to $1,090, then selliug at $1,100, and closing at $1,100 asked. In running west and south from the station in the new shaft, 200 feet below the 425 feet level, a substantial body of quartz has been met with, a portion of whicb carries pay metal. This drift is to intercept the old interior shaft, in the southern part of the miue near the Savage line. At this point the existence of pay ore was long since partially demonstrated in siukiag from above, but more thorough explorations are now to be made. Different portions of tbe old works have shown a decided improvement recently, and it is now estimated that at least 25,000 tons of ore can yet be taken from the upper levels. The average yield of the ores reduced last month was about $48 per ton, and the aggregate receipts amounted to some $165,000.

Savage was very active, and 56 feet changed hands, advaacing from $760 to $800, buyer 30, receding to $725, rallying to $780, droppiug to $750, tbea selliug at $775@760, and closing yesterday at $765 bid. Active operations have been suspended in this mine for ten days past, owing to the re-timbering of the maiu shaft; meaawbile the company's mill has alone beeu employed in crushing ores. A coatract has been made to renew work in the aew E street shaft (aow 200 feet in depth), at $18 per foot, aad arrangements have also beea made to siak two new compartments in the Day shaft. This latter is to attain a depth of 600 feet, aad will develop the miue 100 feet below the present lower level. A decided improvemeat bas takea place recently in the lower and upper levels of this mine.

Alpha has been dull and inactive, and some 17 feet were sold withia a range of $850 and $790, closing at $790 bid, $800 asked. We can learn of no new feature in this claim.

Yellow Jacket was dealt in to the extent of 75 feet, receding from $750 to $660, rallying to $710, dropping to $665, seller 30, and selling yesterday at $670 bid. It is said that some promising developmeats have been made in the southwest drift from the lower level.

Crowa Point declined from $720 to $625, rallied to 650, then sold at $790, and closed at about $720. Tbe winzes from the 230 feet level are now down some 50 feet vertically in good ore. In all about 50 tons of orc per day are now hoisted to the surface. The watcr is subsiding in the 300-feet level, and preparations are being made to start the drift again. Belcher has been more active, and some 30 feet were sold at $450@$400, closing at $400 bid. Large bodies of water still somewhat interfere with a proper development of this mine.

Ophir has continued to be sustained with steadiness, and 90 feet were sold within a range of $385, cash@407½, buyer 30, closing at $392½. Advices from this claim are favorable, and it is said that more substantial indications have been met witb in the drift from the ninth gallery.

Cbollar-Potosi was very actively dealt in, and nearly 500 feet changed hands, dropping from $325 to $285, advancing to $340, buyer $30, receding to $315, rallying to $325, declining to $317½, and selling yesterday at $310@$308. During the week ending November 3d, 520 tons of ore were sent to custom mills, and 630 tons were sold at $8 per ton. The Bajazette ground continues to look well, and the drift north is said to be in fine ore, which is being breasted out. The drift south, for the purpose of intersecting the promising deposit of sulphuret ore found lately in the east cross-cut (485-feet level), has been temporarily interfered with, owing to an influx of watcr. The old Chollar workings, between the third and fourth levels, show some improvement. The new shaft is now down to the drift about to be opened.

Imperial steadily declined from $175 to 156½, rallied to $174, buyer 30, dropped to $168, and sold yesterday at $160@$157 ex-div. The Front Gold Hill company have instituted a suit against the Imperial and other Gold Hill claims, for the recovery of all ground lying outside of their square locations; but, the parties defending do not seem to attach much importance thereto. The Lindauer mill will probably not be employed at present, it not being in an efficient condition. No definite conclusion has been reached in regard to the new shaft. The productiveness of this mine, at no distant day, will depend materially upon the progress of that work, and in the opinion of many stockholders, it should not be further delayed.

Hale & Norcross fell from $200 to $150, rallied to $240, aad then sold at $205@$207½. Empire Mill rose from $175 to $182½, fell to $162, and closes at $163.

Overman has been sold at $50@$70, closing at $62½. Bullion fell from $60 to $45, rallied at $70, and closed at $57½.

Confidence was dealt in at $62½@$77½, closing at $76.

The aggregate sales of Stocks, since Saturday last inclusive, amounted to $832,086.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

HENDY'S IMPROVED BLOW-PIPE.

This Convenient Helpmeet

— TO THE —

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the Press of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or oladder is readily filled at a single breath, and with very little exertion. When so filled, a continous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

Call and examine samples.

Sent by mail, if desired. Address

DEWEY & CO.,

Our Circulation.—The Mining and Scientific Press has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

Mining Summary.

CALIFORNIA.

TRINITY.—The Trinity *Journal* says: "We hear of active preparations for the mining season in every portion of the county, and much intelligence which we have not room to print this week. At Hay Fork unusual activity prevails. Francis & Bark are pushing their ditch to completion with all possible activity. When finished it will open rich diggings for a large number of men. Mr. Francis showed us a two-ounce specimen the other day, and mentioned having taken $700 from one of the claims in a single week. Miners are gathering on the lower river, there being some forty or fifty in the vicinity of Cedar Flat already. The population of the county is increasing, and the times generally cheering.

SHASTA.—We learn from the *Courier* that the Highland mill has made another clean-up from work done in pieces of days amounting in the aggregate to about seven. Result, $3,021. There is not water sufficient to run the mill more than a few hours at a time, and the company is only crushing small parcels of rock. The *Courier* thinks large results will be obtained when they get water enough to run full time. Sam. Grover's new mill, the Honeycomb, is running only four stamps; but is taking up from eighteen to twenty ounces per day from the copper plates alone.

SIERRA.—The *Messenger* says that the quartz mining interests of Sierra have been gaining steadily the last two years; but the numerous rich strikes have created no special excitement outside their immediate vicinity. Work on many prominent ledges is in a promising state of forwardness, and with the erection of several new mills in the spring, and the steady prosperity of others now working, we may expect a healthy activity, such as the miners of Nevada and Grass Valley now so freely enjoy, and which promise something certain for the future.

The claims in the vicinity of Howland Flat are all paying finely, and the miners are happy and contented.

The Keystone mine is making splendid runs of late, with prospects improving. We have received no figures.

NEVADA.—The *Transcript* says that during the past year hundreds of miles of quartz claims have been located, and probably more than one-third of the gold product of the country is from claims struck within two years. Times are better now in this county than they have been for a number of years, and the prospect for the future is bright. Prospectors are confident of the great mineral resources of the county, and for several years to come prospecting will be continued with unabated zeal.

One hundred pounds of rock from the Wagoner ledge was recently worked by mill process, which paid at the rate of sixty dollars per ton.

Capt. Kidd is pushing ahead very vigorously at the Gold Tunnel. That mine has ever been regarded as one of the best in the county, and with the improved knowledge now possessed of working quartz mines and of saving the gold, it ought to pay much better than in former days.

The Grass Valley folks have made another "big strike," whereat there is much rejoicing. This strike was made in what is known as the Brennan tunnel, but which, we believe, was commenced originally by Dr. Delavan, while he was agent for the Rocky Bar company, previous to the advent of Mr. Brennan, who, it will be recollected, got discouraged, and killed himself and family. The lode is a continuation of that owned by Watt & Co. It is now owned by twelve persons, who have spent upwards of three years upon the work since its resumption, and have just been rewarded by fortunes which can scarcely be estimated. The ledge where they struck it is two feet thick, literally studded with gold!

From fifty tons of rock on the Shamrock, located at Forest Springs, a gold brick was recently taken which weighed 136 ounces, and is valued at $2,500. This claim is owned by working men, and the rock was taken out at a depth of ten feet.

The placer diggings of this county appear to be equally flourishing with their quartz claims. The Nevada *Transcript* says that rich gravel has recently been struck in the claims of Tanner & Flint, near Fall Creek. A shaft was sunk to the depth of sixty feet, and gravel struck which prospected as high as six dollars to the pan. The gold is coarse.

The owners of the hydraulic mines are now actively engaged in fitting their claims up for winter operations. Flumes and ditches are being prepared, hose and iron pipe purchased, and all necessary implements prepared for the prosecution of this branch of mining. The miners expect an early and favorable winter for their work, and if they are not disappointed, very large sums will be washed out in the hydraulic claims of this county during the season.

PLACER.—The Placer *Herald* says that the interest in quartz prospecting is increasing from day to day in this county, and locations are constantly being made by old resident miners, as well as by persons from a distance. In several claims the indications are very encouraging for developing rich leads. Work on the Conrad claim has been prosecuted until the shaft is down twenty feet, and at the latter depth some very rich rock has been taken out—the gold being profusely distributed through the quartz. Eastern and western extensions of this lead have been taken up, and gold has been found in the croppings as well as in the dirt adjacent to the ledge.

The Auburn *Stars and Stripes* says, W. W. Dean and others have recently discovered some apparently rich croppings on a quartz ledge one and one quarter miles from Ophir. Selecting specimens from different spots along the ledge for a distance of eight hundred to one thousand feet, they sent them to Waters & Co., of Sacramento, for assay, from which the following results were obtained: gold $69.24, and silver $191.62 per ton, or a total yield per ton of $260.86.

The *Stars and Stripes* thinks that if the same prospects which have been discovered in that neighborhood within the last six months, had been obtained in some districts thousands of miles off, and comparatively inaccessible, the fact would have roused a furore, and started thousands on their way thither.

TUOLUMNE.—We have seen, during the past week, at the publication office of the daily *Flag* in this city, several hundred pounds of exceedingly rich rock, being a sample from a vein about two feet thick, in the Toledo mine, at the Rawhide Ranch, about six miles from Sonora, Tuolumne county, a locality famous for many years past for the extraordinary richness of the quartz in its vicinity. The samples contain a large amount of free gold, and a great percentage of arsenical pyrites rich in gold. According to the *Flag*, this rock assays at the rate of $3,000 per ton! The company owning this mine have spent upwards of $60,000 in prospecting it thoroughly, and having satisfied themselves that the vein is extensive, and rich beyond precedent, they are about to purchase improved machinery and a mill to commence operations for obtaining the fruits of their enterprise and perseverance.

CALAVERAS.—Another important copper strike has been made at Copperopolis, which is thus related by the *Courier*: About two weeks ago, the Kentucky company, located between three and four miles from Copperopolis, commenced sinking a shaft a few hundred yards from the old works. Last week, at a depth of fifteen feet or more, they struck some exceedingly rich ore, and later accounts state that the lead is rapidly widening out and improving in richness. We learn from a gentleman who inspected the lead early this week that at that time it was five feet in width at the bottom of the shaft. The strike is believed to be one of considerable importance, as the ore is worth from forty to one hundred and sixty dollars per ton.

Messrs. Depew & Co. have built a mill on their claim on Sport Hill, for the purpose of crushing the dirt taken out of their tunnel. Experience has proved in this section that the clayey dirt, taken from some of our tunnel claims, pays far better by being worked in a mill than by any other process. Depew & Co. have put up an excellent mill of ten stamps for the purpose of crushing this dirt. It will be run with water from a ditch, and will be started as soon as water comes.

AMADOR.—We condense the following items from the Amador *Ledger*:

George J. Sanger, R. K. McCoy and two other prospectors have struck a splendid lode, at School House gulch, half mile east of Pine Grove.

Frank Lavasso has shown us several fine specimens of blue gold bearing rock taken from a newly discovered lode on his ranch near Pine Grove.

The Aorta, a newly opened mine, owned by Barron, Fake & Co., is turning out some of the richest rock that we have seen for a long time. They have on hand some 80 tons which will pay from $60 to $80 per ton. The mine is located on Grass Valley creek, a half mile north of Pine Grove.

Fogus & Co., purchasers of the Golden Gate mine, have bought Boyle & Co.'s mill on Sutter creek. They are enlarging and making various improvements.

Dr. Wesler is taking out some very rich rock from the Pandora shaft. The mine promises to be one of the richest in that vicinity.

Holley & Stevenson, near Clinton, in putting down a new shaft, found some huge specimens, many of them containing half their weight in gold.

The Union Mill, owned by E. F. Steen and superintended by Capt. B. B. Bliss, is now in splendid order, and turning out fine looking rock for W. J. Paugh.

The *Despatch* learns that the Eclipse mill company are taking some very rich rock out of their claim near Amador City. They had some of the rock crushed a few days ago, which was taken out at a depth of 45 feet, and its yield is said to have surpassed the most sanguine expectations of the members. The lead is nine feet wide and is owned by Messrs. Leach & Co.

VIRGINIA CITY AND VICINITY.

We find but very little of especial interest, the past week, from this vicinity. We append the following items:

We notice that a gang of men are at work selecting the best pay rock from the refuse dumps of the Savage and Chollar Company's claims. Two years ago what is now being selected was then thrown aside as no good, but lately mill men conceived the idea that if selected it would pay to work. Now that rock is a little scarce, mill men are looking out for most anything that pays. We were informed by one of the men that the rock pays about $90 to the ton.

Smelting works have been erected in Genesee District, and are at work on ores from the local mines. New mills, new machinery for mines and new enterprises of all kinds characterize the country, which bids fair to be a most flourishing section.

The bullion shipments from Gold Hill, by Wells, Fargo & Co., during the past week, amounted to the large sum of $106,187 37. Weight of bullion, 3,344 pounds; number of bars, 65.

The Cosmopolitan (copper) claim, over in Genesee District, recently sold for $150,000 to a New York company.

HUMBOLDT.

A correspondent of the Humboldt *Register* says that the present prosperous and happy state of affairs in Humboldt county, notwithstanding her many reverses, her Indian wars, and worthless old quartz mills, is owing to the fact that they can now prove to the satisfaction of every one that they have mines containing untold millions of gold and silver, easy of access, awaiting only the judicious application of capital and labor to open up their wealth and remove therefrom the precious metals. These great truths can no longer be shut out from the world. Money, it is true, is scarce; because every dollar is being invested; but an examination of the mines convinces every one that Humboldt has a future that will place her foremost in the ranks of the great silver-producing regions of the world.

The *Register* asserts that the Arabia mines, in Trinity district, are the great discoveries of the age. The extraordinary width and uniform richness of the ore are said to be astonishing, and that those enormous ledges of rock are silver-bearing, and that the entire mass will yield from $50 to $200 per ton. The Montezuma mine in Arabia, and the Montana mine in Sacramento district, are especially mentioned as the most valuable mines in the State of Nevada. The former, it is said, would support an entire county; the mineral already developed will yield a million of dollars. If such is the case we trust the proprietors will keep it free from the speculating fraternity of this city—a body of men who can add to or take from the selling value of a mine any amount which they may wish, and who do either to accomplish their own selfish ends as they may wish to buy or sell. There are men, and moneyed men, in this city, however, who are honorable men, and who will employ their capital in an honest manner; but such are not those who employ Montgomery street brokers to manipulate mining stocks for them, and who generally contrive to secure the management of such mines as they elect to operate with.

The Essex mine is on the Neptune series, below the Empire claim. Parties have succeeded in disposing of an interest in the claim for a fund with which to develop it. Funds having been sent out from New York for the purpose, four hands are going ahead with the work. The Empire and Tallulah, we believe, are now in the New York market, offered on similar terms.

REESE RIVER.

The Reese River *Reveille*, insists that Austin is now the most flourishing town, for its population, of any place between San Francisco and Salt Lake, and challenges any one to deny the assertion.

Some fine quartz is reported as being found in the Sacramento district. That of the Montana, Bullion, and, indeed, most of the veins, consists of an exceedingly hard quartz of a bluish cast; and as it contains but a small quantity of the base metals, from which silver ore chiefly derives its color, and from which its value is often judged, some have thought the ore from this district was not very promising. A careful examination, however, appears to show that the rock from this district is generally rich, notwithstanding these apparently unfavorable indications. But little work, however, appears to be going on in that district at present.

The Old Dominion ledge, says the *Reveille*, in Blue Spring district, is a monster vein of between 150 and 200 feet thick. The Comet company have located a claim on this leviathan, where it is fully 150 feet wide. In the body of the vein on this claim there is a compact mass of ore, which assays from $28 to $68 of silver per ton. The mine is well located for working. The enormous size of this ledge, as well as the quality of its ore, will render it eventually one of the most famous mines in the world.

The Eureka mill at Canon City, Big Creek, was recently put in motion, with greatly improved machinery and apparatus. It is under the superintendence of Mr. Murphy, late of San Francisco, but now of the assay department of the National Bank of this city.

The proprietors of the Morse ledge, on Lander Hill, recently sent five tons of ore to the California mill for reduction, which assayed $753 of silver to the ton; the mill agreeing to work up to eighty per cent. of the assay. A few very rich specimens may be selected from the vein that will easily assay over a thousand dollars. In our opinion, says the *Reveille*, the Morse will prove a "rich strike" to its owners.

EASTERN CAPITAL IN THE OREGON MINES.

A very handsome sum, said to be as high as $300,000, has been offered by New York capitalists for the Ruckel mine, formerly known as the Rockfellow, and situated on Powder river, Oregon. The property consists of a 10-stamp quartz mill, driven by water power, with an average crushing capacity of fifteen tons per day. The ledge is located on the Emigrant road about seven miles from the mill, and ore is hauled in wagons at a cost of $5 per ton. There are several distinct lodes from which the mill is supplied. There is but little wood or water at the mines; but a great abundance of alkali. The mine was discovered by some old miners as they were passing by on the road. There are good "indications" at intervals for a distance of several miles along the outcrop of this lead. There are also several parallel ledges. The rock contains but little pyritous ore; the gold being mostly free. The main lead was struck by the tunnel 110 feet from the surface, and 116 feet from the point where it was commenced. About twenty-five men are employed about the mine. Col. Ruckel, late president of the Oregon Steam Navigation Company, is the principal owner of the ledge, the work upon which is under the management of Capt. Coffin, formerly of the California Steam Navigation Company.

Wood & Fogus' interest in the Morning Star gold and silver ledge, Owyhee, has been conditionally sold through, or to, a prominent New York banker, for $800,000. Wilson Waddingham has purchased the interest of the White Brothers in the Confederate Star and Idaho, Alturas county, for $25,000, and is in treaty for other valuable ground. Mr. Waddingham has been extremely fortunate in his quartz operations, and is now the proprietor of several of the richest ledges in Idaho. During his late visit to the Eastern States he has not only realized a fortune, but justly earned for himself the character of an upright and honorable man. His fair and impartial representation of the quartz interest has been of incalculable benefit to Idaho, and entitles him to the good wishes of all who desire to see Oregon and Idaho flourish. Mr. Waddingham's success in forming a company in New York affords very good evidence that the miners of Oregon need entertain no further fear that they will want for capital to fully develop the country.

LOOK TO YOUR BLACK SAND.—The black sand from placer tailings, sometimes, contains gold (auriferous sulphurets). It would be well for miners to ascertain if they have such sand in their tailings. A mining company at North San Juan, Nevada county, are saving the black sand, having ascertained that it contains about half the gold in their claim. They have now put up pans for grinding and amalgamating the sand, and expect to save all the gold.

Mechanical.

EFFECTS OF HEATING, ROLLING, HAMMERING, AND ANNEALING METALS.

Elaborate experiments and careful observations have developed many interesting and important facts with regard to the variations of density, etc., which different metals undergo in different degrees, in the operations of heating, drawing, rolling, hammering and annealing.

At a temperature rather above a cherry-red, iron wire will remain three months, surrounded with charcoal, without cementation taking place, while a white heat will, in five minutes, render brittle a square bar of malleable iron, eight-tenths of an inch in diameter.

Wires of copper, and of alloys of copper and zinc, are increased in diameter, and diminished in density, by annealing. The operation of rolling condenses metals more than that of wire-drawing. The density of iron and copper will be greater if the metals are heated before being passed through the rollers. The reverse is the case with alloys of copper and zinc. The density of metals is greatest when drawn into very fine wires. Hence, two small wires are stronger than one large one of the same transverse area with the united areas of the small ones. This result grows out of the fact that the particles of the smaller wires are compacted throughout their entire cross section, while those of the latter are thus compacted for a certain depth only.

Wires may be increased in length in two ways—first, by diminution in the case of its cross section; and second, but only in a slight degree, by increasing the distances between the component particles. When wire is lengthened by the latter process, it returns to its former length by annealing.

Again, wires of certain different metals, after passing through the same hole in the wire-drawing plate, have different diameters; but all such subsequently acquire equal diameters during the process of annealing. The diameter of a wire is said to increase very slowly by time, after passing through a wire-drawing plate. Wires which have been bent, and subsequently straightened, have a tendency to re-acquire the same curvature by time.

Wires exposed to a high heat lose part of their tenacity. They require to be annealed in wire-drawing, not to render them more tenacious, but to allow the particles to resume the positions from which they may again be displaced.

The loss of tenacity is common to copper, iron, platinum, and the alloys of copper and zinc.

Hydrogen has an action on copper and silver, at high temperatures, which permanently separates their particles. On alloys of copper and zinc, and even of silver and copper, it has no such action.

Brass wire approaches to iron in strength, while copper wire is much inferior to it; hence, brass is much used instead of iron where the latter would oxydize too rapidly.

Iron wire is made of different qualities, to stand a strain from 75,000 up to 130,000 pounds to the square inch. The tenacity of brass iron varies from 78,000 to 87,000 pounds to the square inch; while copper wire will part at from 38,000 to 44,000 pounds.

These facts, with many others of a like character, have been carefully arrived at by many and most elaborate experiments, and a knowledge of them is valuable to every mechanic.

Oedino's Reflector.—This is the name of a new invention just patented by John Oeding of this city, and designed as an improvement on the ordinary kerosene lamp. It consists of a simple looking-glass reflector, of any size desired, which is attached to the lamp by a ring, and placed at such an angle as to reflect the light upon the proper place, at the same time it shades the eye from the blaze of the lamp. For writing, sewing, or other work requiring strong light, the reflector will be found very beneficial, while it can be afforded so cheap as to be within the reach of all.

Manufacturing and Tempering Sword-Blades in India.

The swords manufactured in the Regency of Cutch, an English province in Eastern Asia, have long been celebrated in India for their wonderful strength and enduring edge. The following description of their mode of manufacture was communicated to the British public, some years since, by an English army officer who had long held a military command in that province, and who had an opportunity of learning the process of manufacture and tempering employed in producing these wonderful blades:

An inch bar of fine English or Swedish steel is first forced out into plates seven inches long by one inch broad, and one-sixth of an inch thick. Similar bars of very fine soft iron are then prepared in the same manner. These pieces of forged steel and iron are smeared over with a paste of borax, dissolved in water, and laid up in piles of between nine of steel to three of iron, alternately; each pile is then wrapped around with thickly plastered mud, made of a loamy earth; then heated, welded, and drawn out to a bar of one inch and one-eighth broad, and one-third of an inch thick. This is bent over upon itself three or four times, and again welded and drawn out to half an inch in thickness, and during the heat borax is frequently dropped on the metal while in the fire. Two or three bars of this metal thus prepared are next welded into one, and when about twelve or fourteen inches long, is bent into the form of a staple; in the middle of this piece a fine grained file is now inserted, of the same width and nearly as thick as the bent bar; all is now welded together, and the blade then formed.

In tempering, an earthen pot, twelve inches wide and six deep, is notched on the edge, the notches being opposite to each other. The notching is done with a file, and about a quarter of an inch deep. The pot is now filled nearly up to the notches with water, and oil is then poured upon the surface. The sword-blade being heated equally to a light red heat, is removed from the fire, and the point entered into the notch on one edge is passed across the surface of the oil and water to the opposite notch, keeping the edge from a quarter to half an inch in the oil; the blade is thus drawn backward and forward rather slowly till the hissing ceases, and the rest of the blade above the fluid has become black; a jug of water, without oil, is then poured along the blade, from heel to point. In order to take out the warp produced by tempering, the blade, when nearly cold, is passed over the fire three or four times, then placed again upon the anvil, and set straight, by striking it regularly, but moderately, with the hammer. By this means a Damascus-curved blade may be brought nearly straight. Blades made in this way are proved, previously to grinding, by striking them upon stones, ramrods, and gun-barrels. They may even be struck violently upon wheel-tires, or heavy pieces of iron, without injury to the hammered edge.

Duly Appreciated.—We have several times had occasion to speak of the superiority of Hendy's gang circular saw-mills over the ordinary saw-mill, both in the amount of work which it will turn off, and the manner in which it turns its work out. The only mill of this description yet in operation on this coast, is on Little River, Mendocino county. This mill recently turned out 32,500 feet of lumber in twelve hours. The engine that runs this mill is 14-inch bore and 18-inch stroke. The agent here says that the mill is not able to supply the demand, and one of the mills is now being fitted up at Trinidad, Humboldt county, and will soon be sending its lumber into market. One million of feet are now on hand ahead of the supply. This demand arises mainly from the superiority of the quality of the lumber which it produces.

One of the most curious articles of an exhibition now being held in England, says the Chicago *Journal*, is a steam-engine and boiler, in miniature, and described as the "smallest steam-engine in the world." It stands scarcely two inches in hight, and is covered with a glass shade. The fly-wheel is made of gold, with steel arms, and makes seven thousand revolutions per minute. The engine and boiler are fastened together with thirty-eight miniature screws and bolts, the whole weighing fourteen grains, or under one-quarter of an ounce. The manufacturer says that the evaporation of one drop of water will drive the engine eight minutes. This dwarf piece of mechanism was designed and made by a clock manufacturer in Horsforth, England.

An Important Pan Improvement.

The Virginia *Enterprise* gives the following description of the process for enameling amalgamating pans, which, we should suppose, might be of much value and importance:

We yesterday visited the new enameling furnace which has just been constructed, and is about going into operation on H street in this city. The furnace, which is of peculiar construction, is the invention of Mr. John Ramsdahr, and the enamel applied to the invention of Mr. Charles H. Golden. Both the furnace and the enamel are patented. The material used forms on mullers, pan bottoms and the sides of pans a coating similar to the enamel on many iron kettles used for culinary purposes, though unlike this the composition of the enamel we speak of is such that it withstands the action of all kinds of acids. The enamel is intended to be used in coating the interior of pans used in mills where the ores are crushed dry and roasted. It appears that where ores are thus treated, that the roasting with salt decomposes the base metals contained and leaves in the powder a combination of the various acids evolved in the shape of a salt or salts which, on being put into a pan and properly moistened with water for the purpose of amalgamation at once attack the iron of which the pan is composed. Iron pans used in mills where roasted ores are treated seldom last more than from four to six months, when their bottoms are found to be eaten through. The enameled pans will last at least a year and a half—perhaps two years. The enamel is of a brown color when burnt and adheres so firmly to the iron that it cannot be cut off with a chisel. Another peculiar and excellent property of the enamel is, that after having been put upon the iron, no subsequent heatings of the metal affect it. It shrinks and expands with the iron, and, though a pan bottom coated with the enamel were heated red hot and dropped into cold water, the enamel would not be in the least degree cracked or affected. The enamel is of a red color before being fixed to the iron by heat, and is spread on the pans or mullers with a trowel in the shape of a thin mortar. The furnace, which is peculiarly constructed, is of a circular form and sufficiently large to take in the largest sized pan, or pan bottom. Five pan bottoms can be at once enameled. The interior of the furnace is made of boiler iron with a brick wall outside, leaving a space all round of some six inches, into which charcoal can be fed through six iron doors constructed for the purpose. Besides the heat thus obtained there is underneath the furnace a large fire-place for burning wood. After the mullers, pans or pan bottoms have been properly coated with the enameling composition they are placed in the furnace which is covered by two conical lids of boiler iron, the inner one of which is four inches smaller than the outer, and the fires are started. After a red heat has been kept up for twenty-four hours the operation is complete. Although the piece of iron to be coated may stand on its edge, the enamel does not run off when it is melted. The pan bottoms which are now being prepared for enameling are for the Manhattan Mill, Reese River, where the ores are all roasted after crushing, and where they find their pans quickly rendered worthless from the action of the acids in the ores. Mr. Golden was for a long time engaged in the Central Mill in this city, where the dry crushing and roasting processes were used and where he had a good chance to see the necessity for some improvement in pans and ample opportunity for trying all sorts of experiments upon enamels by merely coating pieces of iron with various materials and subjecting them to the heat of the reverberatory furnaces used for roasting ores. The enamel will be valuable for many uses besides the coating of pans; it can be used upon pump tubes and all kinds of iron pipe to protect them from rust.

Prospecting Mill.—The editor of the *Mountain Messenger* informs us that the citizens of Downieville contemplate erecting a small and convenient prospecting mill in that town, for the purpose of affording the miners thereabouts a cheap method of testing their ores. Associations for similar purposes might be formed in many of our mountain towns, greatly to the encouragement of the mining interests of such localities, and the improvement of business generally.

The Borax Yield.—The Napa *Reporter* chronicles the arrival at Napa of a large wagon, laden with 11,500 pounds of borax, from the Borax Lake, in Lake county. The driver informs the editor that he makes semi-weekly trips. Thus it will be seen that about 25,000 pounds of this mineral are shipped to San Francisco weekly by the company. The borax is shipped in boxes of about 200 pounds each.

The Diamond Drill—Its History and a Description of the Machine.

Perhaps the most important improvement which has been effected of late years in the important and constantly increasing business of cutting and dressing stone, is the adoption of the principle employed in what is known as the Annular Diamond Drill, as manufactured by the Annular Drill Company of this city. For many years the method almost universally employed to produce holes or cuts in masses of rock or ore, either in mining, blasting, quarrying, tunneling or stone-cutting, has been the slow and tedious one of percussion, by repeated blows with a steel instrument upon one spot, until little by little the desired orifice was formed.

Several years ago a distinguished civil engineer of Geneva, Switzerland, M. Rodulph Leschot, being desirous of obtaining some more rapid and efficient method of quarrying rock than any then in use, instituted a series of experiments in different modes of cutting. It was not difficult to produce by machinery any desired motion of the cutting instrument, but the great and for a time apparently insurmountable difficulty which intervened was that the hard surface of the rock so rapidly abraded the edges of even the hardest steel instruments that really little practical advantage was gained over the old plan. What was to be done? The answer was at hand.

The diamond had long been employed in cutting and polishing other precious stones; why not employ it in piercing the impracticable rock? It was done. A number of diamonds set in the face of a cylindrical cutter head, at once accomplished all that could be desired, cutting a clean, circular groove (whence the term "*annular*") into the rock, destroying but little of the material, and leaving a core which could be easily removed.

The first application of M. Leschot's plan on a large scale was at Pistoja, Italy, where it was employed in cutting a railway tunnel, and gave the fullest satisfaction to the engineers employed on the work.

A small steam drill, employing this principle, is now in daily operation at No. 144 Greene street, in this city, which fully illustrates at once the manner and the excellence of its operation. With the application of comparatively very slight power, a hole $1\frac{3}{4}$ inches in diameter is pierced in hard granite at the rate of $1\frac{3}{4}$ inches per minute. In North river bluestone, it easily penetrates three inches per minute. Both the cutter and spindle being hollow, enables a stream of cold water to be constantly passed through them, keeping the instrument cool, and effectually clearing the hole of all debris. This machine has now been several months in operation, cutting various specimens of granite, gneiss, North river bluestone, sand-stone, and marble, and thus far with little or no apparent wear of the diamonds.

The invention has been patented in England, on the continent and in this country, and the company owning the patent for the United States are now employed in manufacturing machines for power and hand work, adapted to all the various uses to which the principle can be applied.

For all purposes of rock-blasting, either on land or in submarine operations, it appears to be excellently adapted, as it should operate equally well in any depth of water, or in cutting, excavating or quarrying on land.

In prospecting for coal, or other minerals or metals, it would probably prove a very efficient aid, as the core which it cuts out would show the successive geological formations of each foot of its progress, and enable the miner to drive a shaft with complete assurance of success.—*New York Tribune.*

A Productive Mine.—We learn from Mr. G. B. V. DeLamater that the Cosumnes Copper Co., whose mine is situated about four miles east of Michigan Bar, have shipped this season over one thousand tons of copper ore, of very good quality. Some shipments assaying over 30 per cent. The main shaft is now 380 feet deep and they have copper ore at that depth. With a larger force the ore could be got out and shipped more rapidly. The mine is but five miles from the Placerville and Sacramento railroad, and has a great advantage in shipment of ore, over any copper mine in the State.

Tuolumne Mountain Mining Company.—The annual meeting of this company, for the choice of officers, was held on Monday last, at the office of Byrne & Freeloa, Court Block. We understood that the company have raised and reduced quite an amount of very good rock and that the mine is a very promising one. We have been promised some further particulars with regard to it, which we shall probably be able to give in a week or two. The stockholders are anxious to see a full report of the condition and prospects of the mine.

Mining and Scientific Press.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, Nov. 11, 1865.

THE MINERS' CONVENTION.

So far as we have observed, all the papers published in the mining counties, and some others, have expressed a decided wish for a Miners' State Convention. The only hitch, now, appears to be: How, where and when to call it. The Marysville *Appeal* has suggested that some of the papers published in the mining counties should take the responsibility of making the call. These papers, however, have declined to act in the matter, and some of them have referred the matter to the publishers of the MINING AND SCIENTIFIC PRESS, for the reason that this paper makes the subject of mining a speciality, and is more generally circulated through *all* the mining districts than any of the local journals. We have also received several private letters making the same suggestion. Well, rather than see the proposed Convention dropped, by reason of no one offering to take the responsibility of its call, we have concluded to throw off our usual reserve of modesty, and will venture to name WEDNESDAY, the 17th day of January next, as the time; and Sacramento as the place for holding the Convention. We have placed the day thus distant, with the view of not allowing it to interfere with the holidays. We should be pleased to hear from our cotemporaries upon the matter, and if the call as suggested meets with no special objection, we shall place it in a proper position in our columns, and do the best we can can to make the Convention a success in every particular.

THE MINING BUREAU.—We have received a copy of the Constitution and By-laws of the California Mining Bureau, and are pleased to learn that the association is laboring industriously to carry out the useful purposes for which it has been organized—to advance the material interests of this State and the mining interests of the Pacific Coast generally. Its headquarters are at room No. 7 southeast corner of Pine and Montgomery streets, where it is proposed to establish a mineral cabinet, and where it is proposed to gather and keep full and reliable information with regard to the character and general management of the various mining operations on this coast, for the benefit of the members of the organization and for such public use as shall be determined upon, from time to time, by the association. There is no doubt but that such an institution might be made of great service in developing the mineral resources of this coast, and largely instrumental in collecting useful and reliable information by which the community may be greatly benefited. We trust the affairs of the Bureau may be managed with such a degree of intelligence and discretion as will secure for it the confidence and support of the public, and enable the organization to make itself felt as a power for good.

EARTHQUAKE PHENOMENA.

NUMBER III.

In a former number, under the above head, we attempted to explain the philosophy of the "carthquake-wave," and noted the generally-received theory that all carthquakes, so far as they are developed on the surface, are simply transits of waves of elastic compression, moving outward in every direction from the center of disturbance.

There is a certain class of earthquake phenomena, however, which, by many, is supposed to indicate a character of disturbance which cannot be attributed to waves of this description; among them we may mention an apparently *circling or rotatory motion*, by which objects, such as chimney-tops, etc., are sometimes turned partially around on the base from which they are broken. Such occurrences are frequently noticed in our California earthquakes. A remarkable instance of this class of phenomena is recorded of certain obelisks, standing before the monastery of San Bruno, in Calabria, which were slightly twisted upon their axes in the great earthquake of 1783.

Translatory movements, in a horizontal direction, are also noted as incousistent with this law, by which avenues of trees become displaced, without being uprooted, and patches of ground change their relative positions. Perhaps the most remarkable instance of this character of disturbance is that recorded of the great earthquake of Riobamba, in the province of Quito, South America, which occurred February 4th, 1797. That city was reduced to a complete ruin, and on clearing away the rubbish, many of the land-marks were found to be so mixed up and changed, with regard to their relative positions, that in many cases the survivors were unable to designate the boundary lines of their grounds, and the "Council of Justice" was called on to decide on conflicting claims. In one instance it is said that the ruins of one house were buried up by loose earth, upon the top of which were found the ruins of another.

Earthquakes sometimes manifest themselves by a mine-like explosion—a vertical action from below, upwards—having a tendency to project objects from the surface, either vertically or at a greater or less angle with the horizon. This class of phenomena has also by some been considered inexplicable, under the general law alluded to. A most noted instance of this class of disturbance is recorded of the same earthquake noticed above, at Riobamba, on which occasion it is said the bodies of many of the inhabitants were thrown upwards, at an angle which projected them across a small stream, and landed them upon a hill on the opposite side, several hundred feet higher than the point from which they were thrown. The effect, it will be observed, is much like the explosion of a mine, or some of our steamboat explosions, where heavy bodies are often projected to a great distance.

First, with regard to the rotary or twisting motion: This movement is now generally supposed to arise from the fact that the center of gravity of the body twisted lies to one side of a vertical plane in the line of shock, which passes through that point in the base on which the body rests, and in which the whole adherence of the body to its support, by friction or cement, may be supposed to unite, and which may be called the center of adhesion.

To make this more plain: Suppose the top of a chimney projecting above a flat roof, and also suppose that in laying a course of bricks, near where it emerges from the roof, the mason has very firmly secured the bricks upon the east side of the chimney by a good supply of mortar, while, through carelessness, the same course, upon the west side, has been very lightly and insecurely laid. The adhesion on one side is very firm, while it is very slight upon the other. Now, suppose the wave shock of an earthquake to pass along, the sudden force, which, in overcoming the inertia of the chimney-top, would topple over one which was not properly secured by a tenacious mortar in every part of a course of bricks, would, in the case above described, of one side being held comparatively firm, while the other was quite loose, exert a twisting influence. In other words, the weak side yielding promptly, would decline to move forward upon the crest of the wave, while the stronger side would obey the impulse, and part from its base only from the effect of the twist or leverage which would thus be brought to bear upon it. Hence, after the wave has passed, the chimney will be found in a twisted position, as though it had been submitted to the action of a rotary motion.

There are districts upon the earth which are sometimes exposed to two or more intersecting circles or commotions; like the intersecting circles upon a sheet of water, produced by dropping two or more stones into the same at different points. This peculiar class of earthquake phenomena is produced by simultaneous causes of disturbance acting at the same time, each within the influence of the other. Such a commotion may produce a direct rotary motion upon any given point, or small object, although the disturbance is at the same time directly referable to the general law already pointed out as the basis of all earthquake disturbances.

The translatory movements may also be quite as easily accounted for, without any infringement of this law. As has already been intimated, earth-waves are more or less modified in their progress by reflection and interference produced by irregularities and fractures in the earth's crust. Humboldt informs us, that, when soon after the earthquake of 1797, he made an examination of the ruins of Riobamba, where those translatory movements had been so marked and unmistakable, he found the loose earth had moved, like a fluid, in currents. These movements must, of course, be attributed to the fact that the earth was more firm and solid in some places than in others. It is always noticeable in this city, as well as elsewhere, that earthquake shocks are more distinctly felt on the sand-hills, and on new ground, than in those portions of the city where the buildings rest upon a rock foundation. Telegraph Hill, which is a mass of very firm rock, is much less shaken than any other portion of the city. The cause is obvious, and is analogous to that by which a loosely-constructed chimney is thrown down, while one firmly built, though perhaps upon the same roof, withstands the shock. When the earth-wave comes, the mass of sand has no fastening to the rocks upon which it rests, and by which its inertia may be readily overcome; the consequence is, that the wave in the underlying rocks passes along without any fracture, while the sand strata above, from its lack of cohesion, is thrown backward in the direction from which the shock comes, and its entire mass is disturbed with an irregular and uncertain commotion, producing much greater damage than though it were of a solid, compact body.

The great extent of displacement in the earthquake-waves of Riobamba, may be inferred from the immense translatory movements of loose earth already alluded to. In the case of one piece of ground overlying another, a subsidary movement must have first occurred, and then a forward motion; the bank or wall formed by the subsidence must have been pushed forward and inward over that which had settled. All these complicated movements may be readily conceived as within the limits of the general law which has been laid down.

In this case, however, the translatory movements were probably connected with the vertical or seemingly explosive action, to which allusion has been made. This vertical movement was, doubtless, due to the fact that the town of Riobamba was located almost directly vertical to the center of disturbance. The earth-wave, therefore, must have come upward, and with a violence and extent of displacement that, in favorable localities, developed at the surface a projective force similar to that produced by a blow upon the under side of a table or platform, which will project upwards from its surface any substance which may be lying loose upon it. We may, however, probably receive, with many grains of allowance, the extraordinary reports of human bodies being thrown several hundred feet from the earth. Humboldt, in his "Cosmos," mentions the report, without expressing any doubt of its authenticity; but we can hardly think he believed the report, else he could scarcely have credited the balance of the story which admitted that the ruins of houses, furniture, etc., completely covered the site of the city. If the bodies of the inhabitants had gone upwards and across the river, by any natural force, their furniture, houses, etc., would, undoubtedly, have accompanied them. However this may be, the cause of vertical earthquake shocks is, undoubtedly, as readily referable to the universal law which has been laid down, as any of the other more simple phenomena noted. We shall endeavor to continue this discussion at a future time.

CATALOGUE OF THE MINES OF THE PACIFIC COAST.

We have been shown a prospectus of an "Annotated Catalogue of the Principal Mines and Mineral Properties of the Pacific Coast," which is in course of preparation by Prof. W. P. Blake, from notes and data he has been collecting for several years past. It is designed to give most important and interesting facts regarding our mines, as concisely and briefly as possible, so as to avoid swelling the work beyond convenient proportions, and to include notices not only of those mines that are now successfully worked, but of all that have any apparent prospective value.

As a repository of accurate and reliable information about our mineral resources, the work will be of great value and interest to miners and capitalists, and become a standard of reference both at home and abroad. We understand that Prof. Blake will have the assistance of several persons who are familiar with the different mining districts, and that the work will be ready for the printer on the first of January next. To facilitate the labor of collecting the data and to secure a systematic presentation of the facts, blank forms have been printed and issued, and may be obtained on application by mail to Prof. Blake.

THE COPPEROPOLIS RAILROAD.—The Copperopolis *Courier* thinks there is no doubt but that the railroad projected between that place and Stockton will be completed within two years. Mr. McCarty, and several others heavily interested in the copper mines, have taken hold of the project in earnest, and are determined to see it put through at the earliest practicable day. The rapidly increasing importance of the copper interest in that section, and the necessity for cheaper transportation, urgently demand this improvement. It is moreover, feared, and not without good reason that even next year a sufficient number of teams cannot be found to haul the ore to Stockton, which will have accumulated in Copperopolis and its vicinity between now and spring. A railroad is, in fact, becoming a matter of absolute necessity.

RAILROAD TO HEALDSBURG.—The people of Sonoma county are stirring themselves to build a railroad between Petaluma and Healdsburg, via Santa Rosa. The distance is thirty-eight miles. The country is level all the way, and there is only one stream of any importance to be crossed—Russian River. The road would pass the entire distance through one of the richest agricultural districts in the State, and would open the way for an immense amount of grain and produce which could be raised in Mendocino county. The Petaluma *Journal* says that the stock has all been subscribed, and the ten per cent. required for organization of the company paid in. A meeting for the election of Directors is called for the 31st instant.

IN LUCK.—We understand that J. B. Van Hagan, formerly Sheriff of Nevada county, has recently struck some very rich placer diggings in the Blackfoot country, Montana Territory. At last accounts his claim was paying forty dollars a day to the hand.

TRIAL TRIP OF THE "RESCUE."

On Tuesday last, while sitting in our office, busy over "musty books and papers dull and dry," a note was handed us from Messrs. Goddard & Co., of the Pacific Iron Works, informing us that the above-named event was to take place at two o'clock that afternoon, from North Point Dock, and "round the bay," and inviting us "to be on hand." Nothing loth to breathing the free air for awhile, in company with such a party as we knew that Mr. Austin and Captain Griffith would be sure to call together, we gladly accepted the invitation, and the appointed hour found us standing on the deck of one of the neatest little "crafts that has ever sailed in San Francisco bay," decked with flags and streamers from stem to stern, and looking every way

"Fit to be a bride of the grey old sea"

A party of some twenty-five or thirty invited guests were on board, among whom we recognized Mr. Lewis Leland, of the Occidental Hotel, Commodore Allen, and many others of our well-known citizens, besides several commanders of vessels now lying in the harbor. Owing to the non-arrival of one of the guests, the departure of the vessel was postponed for half an hour, which was very agreeably spent by those present in admiring the beautiful model and solid workmanship of her hull, and speculating in regard to her speed. In company with Mr. Austin, we passed through the hold of the vessel, and enjoyed a fine opportunity of viewing the machinery while at rest. The screw is driven by a single vertical engine thirty-six inches in diameter of cylinder, and thirty inches stroke, with an estimated capacity of five hundred horse power. The propeller shaft is nine inches in diameter, and the screw ten feet. The boilers, two in number, are each sixty-two inches in diameter, with four inch tubes, and a horizontal steam drum forty-two inches in diameter and eight feet long. She is supplied with one 10-inch wrecking pump, and one 6-inch bilge pump (independent), besides one 5-inch engine bilge-pump, and one 5-inch feed pump. The hull is 104 feet long at the water-line, twenty-five feet beam, and draws eleven feet aft and six feet forward.

She is intended for a tug-boat for the harbor, and is owned by an association of merchants and navigators, and commanded by Capt. Griffith, one of her owners, whose high character as a gentleman and a seaman is well known to the shipping and business community of our city.

The whole of the machinery was designed by Mr. Austin, and constructed at the Pacific Iron works, of which he is superintendent. He took especial delight and pride in showing and explaining it, a pride which the machinery, both in appearance and working, fully justified.

At half-past two, the party being all on board, the little steamer cast loose from her moorings, and after running a short distance in the direction of Alcatraz to obtain sea-room and a good start, she was headed southward, and sped rapidly along the city front. As we were starting, the piercing notes of a "calliope" burst upon our ears, revealing to the guests the design of a mysterious-looking inclosure of canvas perched on the roof of the little cabin, just back of the pilot-house, which had for some time awakened their curiosity, and now filled them with delight. Passing along the crowded wharves with streamers flying and music playing, and her happy crew of excursionists laughing and singing, she was saluted with whistle and bell by the steamers, and dipping of ensigns by all the other vessels; which salutes the little "Rescue" returned in gallant style, all the while running with arrow-like speed, the water parting from her gracefully curved bows in two unbroken waves, as though it merely divided of its own accord, and not because a huge mass of oak and iron was being driven through it at the rate of fifteen miles an hour, regardless of wind and tide. During this run the engine worked admirably, making, with fifty-five pounds of steam, eighty-two revolutions of the screw per minute, and giving the vessel a speed of fifteen knots an hour, though her screw was made for towing, and not with special reference to speed.

After running southward as far as Hunter's Point, she returned by the same route, receiving and giving salutes on every hand, and passing down the seaward side of Alcatraz and Angel Islands, and through Raccoon Straits she returned along the city front to Pacific street wharf. The day was glorious, the champagne excellent, and the cakes and cheese delicious. The Rescue and everybody connected with her was toasted, from the commander to the man that made the cheese, a rousing bumper being drained to the man who played the calliope; and when at a quarter of five o'clock she landed at Pacific street wharf, the delighted guests and the immense throng on the wharf joined in three hearty cheers for the "Rescue," her builders and commander. Mr. Austin and Capt. Griffith embraced each other as in a transport of joy, and the company parted, each one evidently feeling that "it was good to be there."

A USEFUL MINING INVENTION.

E. D. McCarthy, of this city, has invented a vulcanized India-rubber tappet for quartz crushers, for which he claims many advantages over the kind at present used. The want of a tappet not liable to break or get out of order has long been felt by mill men. This invention appears to fully accomplish not only that, but does away with the principle part of the clattering noise so disagreable in a quartz mill, and which effectually precludes all attempts at conversation. Persons at all acquainted with quartz mills are aware of the serious inconveniences and frequently heavy losses from "smash-ups," resulting from the breaking of machinery, caused by the tappets getting loose and slipping on the shaft. This tappet is formed of a hollow cylinder of vulcanized india-rubber, the same as are used for car-springs, on railroads, etc., and in the same form as the ordinary iron tappet; and when once forced to its place on the shaft by screw pressure, it cannot be moved from its seat by any force or number of blows. It can only be removed by a steady screw pressure in the same manner as it was put on. A small apparatus for this purpose is furnished to every mill using the tappet. Again, it not unfrequently happens that in reversing an engine some part of the machinery is seriously injured and broken by the cam coming in reverse contact with an unyielding iron tappet. In the use of this improvement the only trouble will be the simple loss of a tappet, through the yielding substance of which the cam will plough its way without doing any other damage. The under face of the tappet, when it comes in contact with the cam, is protected by a moveable steel plate, which can be readily replaced when worn out. The first cost of one of these tappets is a trifle less than one-half that of iron, its transportation over the mountains not a fifth part as much, while it will wear much longer. In fact the tappet itself will wear for a great number of years—the only appreciable wear coming upon the moveable shoe. This apparatus will be known as the "Noiseless india-rubber Tappet." Mr. McCarthy has applied for a patent for his invention through the Mining and Scientific Press Patent Agency. One of these improved tappets may be seen at the Metropolitan Steam Coffee and Spice Mills, No. 25 Second street, in this city.

Patent Right for Sale.—The exclusive right for the manufacture and sale of "Hutchinson's Wine and Cider Mill and Press, for the States of California and Oregon, is advertised for sale in another column. It is a valuable patent, and the offer affords a fine chance for business.

OUR NEW YORK AGENCY.

Mr. Geo. M. Newton is our authorized agent in New York City, and will receive advertisements and subscriptions for the Mining and Scientific Press at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "Stockholder," **No. 72 William street.**

PHILADELPHIA AGENCY.

Parties wishing to subscribe or advertise in the Mining and Scientific Press can be accommodated by calling upon our Agent, Mr. Turner Hamilton, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

Virginia Lode, Coulterville.—We have before us a very elaborate and well written report upon the Virginia lode, Coulterville, belonging to Capt. John P. Baker, Capt. J. M. Aiken, and others. We gather from this report the following particulars: The mine lies about three miles from Coulterville, near the southeast base of Buckhorn mountain. The mine is favorably located for being worked, with an abundance of wood and water for steam purposes, and for timbering. The lode is a very heavy one, well developed, varying from five to fifteen feet in thickness. A large amount of ocherous earth appears to be associated with the vein, which shows considerable free gold in the pan. The explorations of the mine, thus far, consist of three or four open cuts at different points along the line of the outcrops, and two tunnels. The vein shows bold outcropping throughout nearly its whole extent. Very rich rock is found at a point where a small ravine crosses the lode. Four assay samples selected by Mr. Clayton from various parts of the lode, where it is exposed, gave the following results:—$998.20; $109.80; $83.10; and $25.45. These results indicate the uniform gold bearing character of the vein, and also a high average grade of richness. The best pay rock in these veins appear to be in the first three feet of the hanging wall. The rock is here interlaminated with strata from six to eight inches thick, carrying more or less of the ocherous substance already alluded to. The gold is found principally in these strata or layers, and is very easily separated from the vein rock. It is pronounced to be a promising and valuable mine, with large quantities of pay rock in the croppings, and the best of evidence that it is a deep-seated and true vein.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Ruggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the Mining and Scientific Press. 19v11tf

To Blacksmiths.

An excellent, strong lad, from the interior, 17 years of age, desires to learn the Blacksmith's trade. His parents wish him to engage with a reputable firm, and learn his business thoroughly. Address, or inquire at the office of the Mining and Scientific Press. 2v11tf

Just and True Economy
IN MINING ADVERTISING.

The Proprietors of the Mining and Scientific Press would call the especial attention of Mining Secretaries, Trustees and Shareholders, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The Press enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the Press is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the Press, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the Press or some other paper.

6th. Many copies of the Press are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, unframmeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the Press, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

Last, but not Least.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the Press shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

MINING BLANKS
For Sale
AT THE
OFFICE OF THE MINING AND SCIENTIFIC PRESS,
No. 505 Clay Street, corner of Sansome.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186, according to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]
Dated 186

Assessment Notice.

..... Company
.....
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ....., 186, an Assessment of .....per share was levied upon the Capital Stock of said Company, payable on the ..th day of .....186, in United States gold and silver coin to the Secretary.

Any stock on which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186, to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.
Office.....

Notice.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186, the several amounts set opposite the names of the respective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophilus Thistle	23	14	$140 00
Peter Pipe	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ....., 186, so many shares of each parcel of said stock as may be necessary, will be sold at the.....
....., on ....., the ..th day of....., 186, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.
Office.....

☞ Our advertisers are furnished with blank Assessment Sale notices free of charge. Orders from the interior promptly filled, by mail or express, as may be desired.

Traveling Agent.

Mr. Robert Lattimore is now on a canvassing tour for the Press through Butte, Colusi, Tehama, Shasta, and Siskiyou counties, and we recommend him to the favorable consideration of our friends.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

Postponements.—We would again call the attention of Secretaries to a certain point of the mining law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

English capitalists have purchased $600,000 worth of Colorado mining lands, and their agents and employees are en route to develop the same. The claims are principally in Russell and Trail Run districts, and their recent purchase has been the Seaton lode of 1,000 feet, for which they paid £100,000 alone.

Their Object.—A St. Louis paper says that the principal aim of Speaker Colfox and party in visiting the west is stated to have been to ascertain the immediate importance of a railroad to the Pacific. Their report is unanimously in favor of the early construction of the road.

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

The Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Machinists and Foundries.

H. J. BOOTH. GEO. W. PRESCOTT. I. M. SCOTT.
UNION IRON WORKS!
Corner First and Mission streets,
SAN FRANCISCO.
ESTABLISHED IN 1849.

Having increased our facilities in every Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.
Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.
Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.
Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wakice's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,
Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.
We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron.
All work done in the best manner at the lowest cash prices.
21v10 H. J. BOOTH & CO.

Miners' Foundry
—AND—
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.
Every description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as
Steam Engines and Boilers, Flour, Saw and Quartz Mills,
Machinery, Mining Pumps, Amalgamators,
Retorts, Etc., Etc.
Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.
, Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities. Free of cost.
All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.
HOWLAND, ANGEL & KING.

Vulcan Iron Works Company
[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.
IRON FOUNDERS,
Steam Engine and Locomotive
BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.
These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.
The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as
Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Flouring Mills,
Locomotives, Quartz Mills,
Car Trucks, Sugar Mills,
Car Wheels, Saw Mills,
Housings and Irons; and
Manufacturing Machinery of Every Kind.
Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR;
BEATTIE'S AMALGAMATOR;
HESSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;
FAUCHERE'S QUARTZ GRINDER AND WATER WHEEL;
JONVAL'S IMPROVED WATER WHEEL;
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS;
STEVENS PISTON PACKING RINGS.
They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, Horse Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.
Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

JOHN P. GALLAGHER. JOSEPH WEED.
GALLAGHER & WEED,
BRASS AND BELL FOUNDRY
And Lock Factory.
ALL KINDS OF BRASS AND COMPOSITION CASTINGS AND FINISHING DONE WITH NEATNESS AND DISPATCH.
Church and Steamboat Bells, of all sizes, made to order. Engineers' Gongs made and hung in the best manner. Bank, Vault, Store and Prison Locks; also Brass Padlocks and Shop Locks of various patterns, on hand and made to order.
☞ Particular attention given to casting Rudder Braces and Ship Work in general.
☞ All Jobs promptly attended to. Prices moderate. ☜
No. 125 First street, opposite Minna next door to Pacific Foundry. 16tf

TIN ORE IN OWYHEE.—The Owyhee *Avalanche* reports the following as a veritable and reliable discovery of tin ore in that region:

In May last, Mr. W. W. Williams' attention was attracted by the weight and character of what appeared to be pebbles, in Jordan Creek. He selected a fine specimen as a curiosity, and carried it, till some two weeks since he showed it to Mr. Thos. McDonald, an experienced assayer of Humboldt county, Nevada, who tested and pronounced it a rich specimen of "stream tin" ore. As an evidence of his faith, Mr. McDonald, James T. Maclean, and W. W. Williams, immediately left Humboldt for this place, where they arrived during the past week. They have prospected the creek and find the ore in large quantities, and have fully satisfied themselves that it is tin—much of it seventy-five per cent. in value. They are confident that a rich lode of this important metal is near at hand. Specimens will be immediately forwarded to the State Department at Washington, to Professors Silliman and Torrey, and to the Secretary of Idaho Territory. A large bounty has been offered by Government for the discovery of tin in the United States in workable quantities. If this is still offered these gentlemen claim it. Specimens may be seen at this office.

NEW SUPERINTENDENT.—Mr. J. W. C. Maxwell, formerly of the Jewett Mine, has been appointed superintendent of the Overman company, in the place of Mr. C. C. Thomas, resigned. Mr Maxwell is an old miner, and under his care the Overman will be sure to strike pay rock if it can be found in that neighborhood.

CALL STABLE.

N. GISHWILLER

Would respectfully inform the public that he has opened a large and well-arranged LIVERY STABLE,

On B street, Summit City, Cal,

(two doors below the Lake House), where good Saddle and Buggy Horses can be had at all times. Our charges will be reasonable, and we hope, by prompt attention, to merit a share of the public patronage. 10v11-3m

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

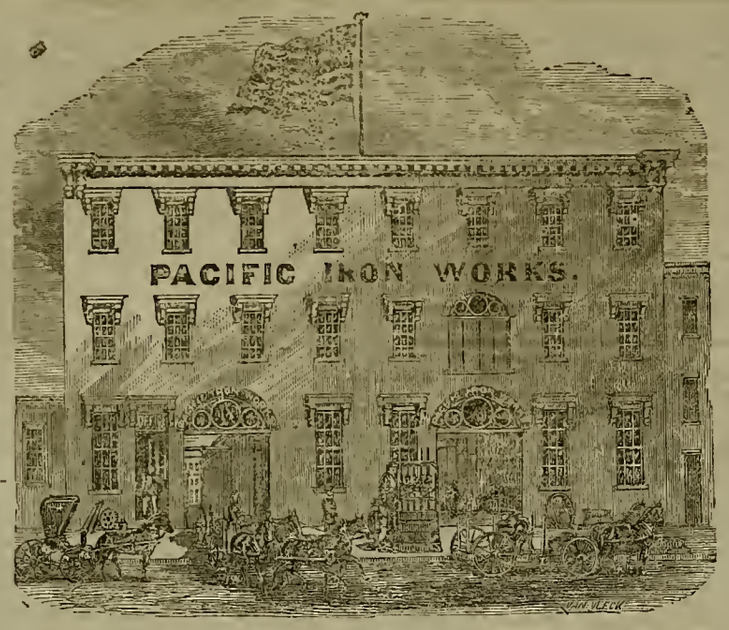
The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11 3m



THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

QUARTZ OPERATOR'S HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL, Authors and Publishers.

Bound in Cloth—144 Pages, Duodecimo.

The Quartz Operator's Hand Book is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tracery and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs. W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Bishaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable Quartz Miner's Hand Book.

The Table of Contents of this book will be found on pa 415 of the Mining and Scientific Press of July 1st, 1865

Sold by booksellers generally. Price by mail, postag paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

AGENTS WANTED

—FOR—

The Secret Service, the Field, the Dungeon, and the Escape.

—BY—

ALBERT D. RICHARDSON,

N. Y. Tribune Correspondent.

1,000 COPIES SELLING PER DAY!

The most interesting and exciting book ever published, embracing Mr. Richardson's unparalleled experience for four years. Travelling through the South in the secret service of the "Tribune" at the outbreak of the war, with our armies and fleets, both East and West, during the first two years of the Rebellion; his thrilling capture; his confinement for twenty months in seven different rebel prisons; his escape, and almost miraculous journey by night of nearly 400 miles. It abounds in stirring events, and contain more of the fact, incident, and romance of the war, than any other work yet published. Horace Greeley says of it:

"A great many books will yet be written concerning this war, in addition to the many already in print; but not one of them will give, within a similar compass, a clearer, fuller, more readable account, entirely from personal observation, of the nature, animus, purposes, tendencies, and instrumentalities of the slaveholders' rebellion, than does the unpretending narrative of Mr. Richardson."

Teachers, ladies, energetic young men, and especially returned and disabled officers and soldiers, in want of profitable employment, will find it particularly adapted to their condition. Send for circulars. Address

SCRANTON & BURR, Agents. 14v11-4t

Worth's Telegraph Reel.

Messrs. Dewey & Co.—Dear Sirs: I see a notice in your paper in regard to my Paper Reel, signed Henry McGann. All I have to say is, if I had invented such a Reel as his, in 1862 or 1863, and had not improved it more than he has, I would keep my name to myself, and not let the public know who I was. His notice puts me in mind of Shakspeare's play of "Much Ado About Nothing." My Reel is entirely different from his, and is considered, by operators who are judges of such things, to be the best; and as for the cord, I could rig one to my Reel that would run a week, but it is not necessary.

For the best Paper Reels, address

L. W. WORTH, Sonoma,

15v11tf Or, WM. LUNDBERG, San Francisco.

Camargo Gold and Silver Mining Company, Lander county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 21st day of October, 1865, an assessment of five dollars ($5) per share was levied upon the capital stock of said company, payable immediately, in United States currency, to the Secretary, No. 402 Front street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid before Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 9th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. oc21

Notice.—The Annual Meeting of the Stockholders of the Caledonia Tunnel and Mining Company, for the election of Trustees for the ensuing year, will be held at the office of the Secretary, on Monday, November 13th, at 3 o'clock P. M.

J. M. BUFFINGTON, Secretary.

San Francisco, Oct. 13, 1865. oc14

Comet Petroleum Company, Humboldt County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of October, 1865, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable on the 14th day of October, 1865, in United States gold and silver coin, to the Secretary, at the office of said Company, in San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

L. CROSBY, Secretary.

Office, No. 36 Exchange Building, N. W. corner Washington and Montgomery streets. oc14

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Removal.

The Office of the Mining and Scientific Press has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and au extensive Job Printing Office.

San Francisco, April 10th, 1865.

Colorado Mill and Mining Company. The Annual Meeting of the Stockholders of the above Company, for the election of a Board of Trustees for the ensuing year, will be held on Monday, November 13th, 1865, at 7 o'clock P. M., at the office of the Company, 509 Clay street, San Francisco, California.

G. M. BURNHAM, Secretary.

San Francisco, Oct. 12, 1865. oc14

Eagle Quartz Mining Company—Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24d day of October, 1865, an assessment of seventy-five (75) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 605 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 11th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOHN M. BURNETT, Secretary.

Office, 605 Montgomery street, San Francisco, Cal oc28

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco, Cal. nov4

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,
Publishers Mining and Scientific Press.

Keokuk Gold, Silver and Copper Mining Company, Clayton Mining District, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 16th day of October, 1865, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable on the 21st day of October, 1865, in United States gold and silver coin, to the Secretary, at the office of the Company, 308 and 310 Front street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 18th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

A. B. WINEGAR, Secretary.

Office, 308 and 310 Front street, San Francisco, Cal. oc21

La Favorita Mining Company, Montezuma District, Sonora, Mexico.

SAN FRANCISCO, Oct. 25, 1865.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of October, 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable on the 26th day of October, 1865, in gold coin of the United States of America, to the Secretary, at the office of the Company, 429 Sacramento street, in the City of San Francisco, Cal.

Any stock upon which said Assessment shall remain unpaid on the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 9th day of December, 1865, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees.

E. WASSERMAN, Secretary.

This assessment will liquidate the Company's indebtedness in full.

E. WASSERMAN, Secretary. oc28

Madison Gold and Silver Mining Company, Lander County, Nevada.

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of September, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at the salesrooms of Olney & Co., 626 Montgomery street, San Francisco, on the 13th day of November, 1865, at the hour of 2 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco. oc28

Mount Davidson Gold and Silver Mining Company, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 2d day of November, 1865, an assessment of one dollar per share was levied upon the Capital Stock of said Company, payable on the 3d day of November, 1865, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 20th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

G. PARDOW, Secretary.

Office, 53 Montgomery Block, San Francisco. nov4

Oroville Gold and Silver Mining Company, Oroville, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of October, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 434 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 18th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 2d day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

oc14 ROBT. P. LEE, Secretary.

Simpson Mining and Milling Company, Mokelumne and Excelsior Districts, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of October, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable on the 31st day of October, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 55 Montgomery Block, City and County of San Francisco, State of California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 16th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. CUNNINGHAM, Secretary.

Office, No. 55 Montgomery Block, southeast corner of Washington and Montgomery streets, San Francisco. nov4

Segregated Belcher Mining Company, Gold Hill District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of October, 1865, an assessment of four dollars per share was levied upon the capital stock of said Company, payable on the 28th day of October, 1865, in United States gold and silver coin, to the Secretary, 318 California street, City and County of San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 9th day of November, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, No. 318 California street (up stairs), San Francisco, California. oc28

Southern Light Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 7) of fifty cents per share, levied September 25th, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount
Hardy, Jas H	bal 51	5	$2 50
Work, Geo	195	2	1 00
Sharp, G F	45	4	2 00

And in accordance with law, and an order of the Board of Trustees, made on the 25th day of September, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at the office of the Company, No. 228 Front street, San Francisco, Cal., by Jones & Beodixen, auctioneers, on Wednesday, the 15th day of November, 1865, at 3 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

E. J. BRINKHOUSE, Secretary.

Office, No. 228 Front street, San Francisco, Cal. oc28

Santa Cruz Petroleum Oil Works Company, Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 23d day of October, 1865, an assessment (No. 14) of forty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, R. WEGENER, 415 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Thursday, the 14th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

R. WEGENER, Secretary.

Office, 415 Montgomery street, San Francisco, Cal. oc28

Notice.—The Stockholders of the San Fernando Petroleum and Mining Company are requested to attend a meeting at the Office of the Company, on the first Monday in October, for the purpose of electing officers for the ensuing year.

A. N. CLARKE, Secretary.

ADJOURNMENT.—The above meeting was adjourned by a minority of the Stockholders, to the first Monday in November.

A. N. CLARKE, Secretary.

ADJOURNMENT.—The above meeting is hereby adjourned to the second Monday in November.

A. N. CLARKE, Secretary.

Office, 121 Montgomery street, San Francisco. oc7td

Table Mountain Copper Mining Company, Stonislaus District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 1st day of November, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, in San Francisco, or to J. M. PIKE, Superintendent, at Copperopolis.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 18th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, No. 436 Jackson street, San Francisco, California. nov4

Wide West Mining Company, Esmeralda District, Esmeralda County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of October, 1865, an assessment of five ($5) dollars per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 103 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 18th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. P. DAVIS, Secretary.

Office, 103 California street, San Francisco. oc21

GEOGRAPHICAL LOCATION OF AUSTIN.—Mr. Wm. Epler, U. S. Deputy Surveyor, arrived in Austin last evening with five assistants, having just completed a survey of the fourth standard parallel from the Truckee river, a distance of one hundred and fifty miles eastward, thus completing this parallel three miles east of Grub's Wells, which is some forty-three miles east of Austin. He commenced this survey on the 18th of September, and finished it on the 24th inst.

Mr. Epler states, according to Lieut. Ives' observations, taken at Lake Bigler, that Austin is located in 39 degrees 29 minut s 31 seconds north latitude, and 117 degrees 4 minutes of longtitude west from Greenwich; and that its survey location is Township 19 north, range 44 east Mount Diablo meridian. Mr. Epler and party leave Austin this evening in their own conveyance, for Carson.—*Reese River Reveille.*

Deserved Testimonial..

GRIZZLY FLAT, Oct. 18, 1865

MESSRS. HUNGERFORD & HENRY—*Gentlemen:* We have run your Concentrator for several days past, in our 5 stamp Mill, and, as far as can be ascertained at present, it is a perfect success. When running at the rate of from two hundred and ten to two hundred and twenty-five revolutions per minute, we have lost neither quicksilver nor sulphurets. Formerly, when using copperplate riffles and blankets, we found that in spite of the utmost precaution, quicksilver would escape over them all. Wishing you all success, we remain Your obedient servants,

E. A. BIGLER.
S. F. DAVIS.

Accountant and Mining Secretary

Has removed to

No. 415 Montgomery Street—wes side,

Between Sacramento and California sts.,

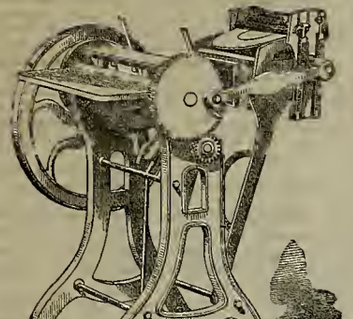
6v10 SAN FRANCISCO.

STILL PROGRESSING!

THE OFFICE OF THE

Mining and Scientific Press

was removed, April 8, to the old printing stand lately known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets (one block south of our former location), where we have consolidated with a



JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for

CHEAP, RAPID AND FINE PRINTING.

We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,
BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.

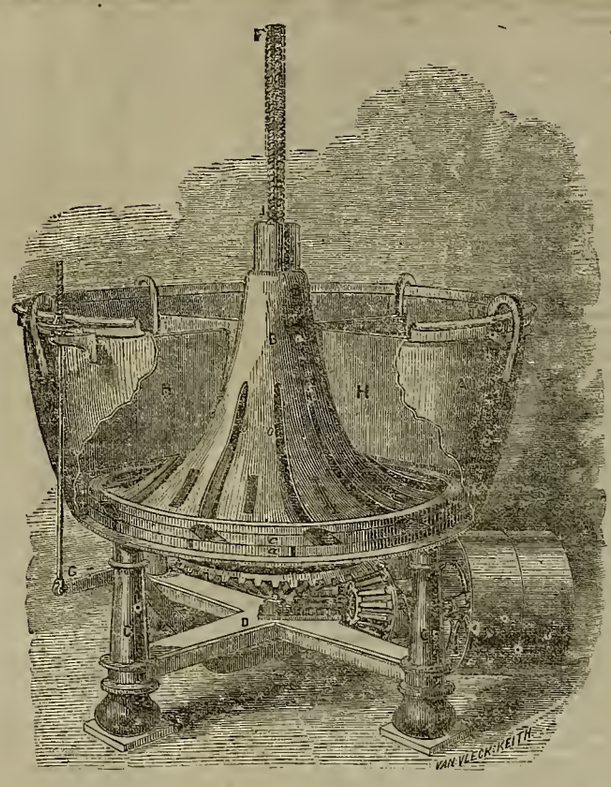
City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

E. D. WATERS, JR., } Proprietors. { W. B. EWER,
C. W. M. SMITH, } { A. T. DEWEY,

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINing Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.

San Francisco, Oct. 12, 1865 15vt1lf



THE EXCELSIOR

GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Traetory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Traetory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

ANOTHER CALIFORNIA NATURAL WONDER.—The Auburn *Stars and Stripes* calls the attention of the scientific inquirers to the following natural curiosity, which the editor assures his readers is an actual reality and no hoax:

On the El Dorado side of the Middle Fork of the American river, nearly opposite Forest Hill there is a rift or chasm, of crater-like appearance, in the side of the mountain which towers above that stream. This chasm is about three rods in length, and an average width of fifteen feet. Numerous attempts to fathom it indicate immense depth, many considering it bottomless. Lines of great length have been lowered without reaching the bottom. Large stones have been dropped into the crater, and the noise of their striking from side to side has resounded until too faint for the acutest sense of hearing. Letter envelopes dropped into this chasm will hang suspended as if in a strong upward current, then dart suddenly down, as by the force of a counter current, and after a lapse of several minutes will ascend, several having been recovered, all of which were found to be sooty and begrimed. The counter-currents of air would seem to indicate connection between this and other similar chasms, while the discolored appearance of the paper indicates the vicinity of subterranean fires or gases.

NOVEL COMBAT.—The New Bedford *Standard* says that a three months' Cochin China rooster had a mortal combat with a full grown rat recently. The fight was well contested on both sides, and after a continuance of thirty-five minutes ended in the death of the rat.

COPPER FROM PLUMAS.—The Marysville *Appeal* of the 5th inst., says: "We noticed yesterday, at the steamer landing, fifteen or twenty cakes of copper matte, from Taylorville, Plumas county, for San Francisco."

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Machinery.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This will can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

24v9

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and fines, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

JOHN MAILER,

Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco

23v10

HUNTER'S PREMIUM CONCENTRATOR, AMALGAMATOR AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; no trace of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delays, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. (Illustrated in the Mining and Scientific Press, April 9th, 864.)

HEPBURN & PETERSON.

BLAKE'S QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA, WASHOE, ENGLAND, FRANCE,

— AND —

THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

ATTENTION, MINERS!

LINSCOTT'S PATENT CHAMBER DRILL.

Great Improving in Blasting.

W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.

D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ¾ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1¾ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

BAUX & GUIODS Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

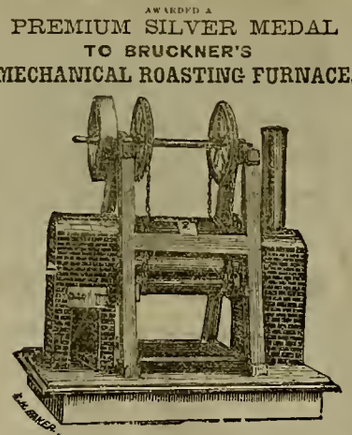
Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

The Mechanics' Institute AWARDED A PREMIUM SILVER MEDAL TO BRUCKNER'S MECHANICAL ROASTING FURNACE.



Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

12v11 416 Market street, San Francisco.

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person, and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

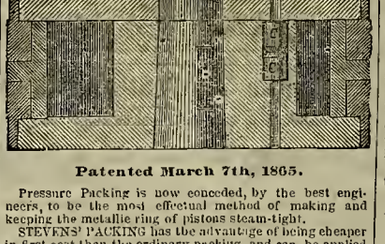
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

STOW'S PATENT CHAMBER DRILL.

The greatest Labor-saving Machine ever invented for Quartz Mining. By using this Drill in shafts, tunnels, and all other rock blasting, three-fourths of the labor and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 1½ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, September, 1865, a Committee, after examining both the Lincoln's and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for blasting rock, for the following reasons:

1st. For simplicity of construction;
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for $20, with one set of Cutters or Chisels that will chamber from 75 to 150 holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 7 Government Block, corner Sansome and Washington streets, and at No. 511 Market street.

Drills will be delivered to any part of this State free of expense to the purchaser. Any information desired, or orders for Drills, address

STOW & COLLINS,
San Francisco.

Oil Wells! Oil Wells!!

I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ½ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to and work with any common drill at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

HENRY M. STOW,
14v11 San Francisco.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S AMERICAN DOUBLE TURBINE

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,

At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

SALMON'S PROPELLOR AMALGAMATOR — AND — Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 **J. & W. C. SALMON.**

OIL WELL BORERS.

A CONTRACT WILL BE LET TO A RESPONSIBLE party to sink an Oil Well, as deep as may be required, on land belonging to the "Eel River Oil Company," situated in Humboldt county, Cal. For particulars, inquire at the office of the Company, No. 435 Jackson st., up stairs.

12v11-1m E. H. WILSON, Secretary.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a Caveat is that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we a cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, and gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

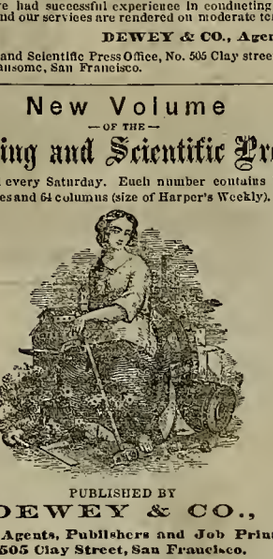
We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

New Volume
— OF THE —
Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).



PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers

505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

New Invention.

ROSENFIELD'S PATENT SAFETY WHIPPLETREE—the greatest thing out. The attention of all owners of Horses and Buggies is called to this valuable LIFE and Buggy saving invention, and which can be attached to all buggies and vehicles without any changes in the harness or buggy, and can be easily secured to any carriage in fifteen minutes. The great value of this Whippletree is, that a runaway horse can be instantly detached from a carriage without taking any portion of the vehicle. The public are invited to call and see it, and orders for the Whippletree left at No. 420 California street (northeast corner of California and Leidesdorff streets), Room No. 1, from 10 A. M. to 5 P. M., will be promptly attended to. Letters dropped through the Post Office, Box 1,944, will be promptly and fully answered. 18v11-1m

THE NAPOLEON COPPER MINE.—The Stockton *Independent* says that the Napoleon and the Hughes copper mines have recently been merged into one company, with a capital of $1,200,000, divided into 12,000 shares at $100 each. The California owners have transferred 7,000 shares – a majority interest — to New York capitalists, who agree to furnish for the thorough development of the mine a working capital of not less than $100,000, to be assessed upon the 7,000 shares of the New York interest; the California owners to hold their 5,000 free from assessments. Pending the organization under the new arrangement, work upon the mine has been suspended. The New York parties who are to take hold of the work are men of capital and energy, some of whom have had considerable experience in copper mining. Work upon the mine will shortly be resumed and prosecuted with energy.

AMALGAMATING BY ELECTRICITY.—We would invite the especial attention of our readers to a very full *resume* of the various projects for extracting the precious metals from their ores, by the use of electricity as an assisting agent. Our correspondent, Dr. Laaszweert, has given a full history of all that has been done or is known on this subject, from the time of the first discovery of galvanism to the present day. We have frequently been asked what has become of the electro-process of amalgamation, which we noticed several times during the summer of 1863, as in course of experimental operation in this city. That question is fully answered by our correspondent, as above.

A NATURAL CAVE.—Two weeks since it will be remembered that we published a statement of a large body of water having been struck in the Pike Tunnel, on Union Hill. The Grass Valley *Union*, of a later date, says that after the water had sufficiently escaped to permit of working, the men employed in the mine discovered a large cave, natural in its formation and running back a considerable distance in the tunnel. In fact, so extensive is this cave, that no one has yet been enabled to trace its termination. It is quite a curiosity, and is daily visited by large numbers of novelty-seekers.

EX-PRESIDENT DAY, of Yale College, is the oldest citizen of New Haven. He is in his 93d year, and when he wants to get around town, prefers walking to any other method of locomotion. He is the father of Sherman Day, Mining Engineer of this city.

THE AMADOR LEDGER has entered upon its *eleventh* volume. The *Ledger* is one of our most valuable interior exchanges.

THE NEW METAL—TUNGSTEN OR WOLFRAM.

The existence of this metal has long been known; but so intractible is its nature, and so difficult is it found to isolate it from its ores, that but small quantities have hitherto found their way into commerce. The metal is obtained with comparative facility in the shape of a dense gray powder; but great difficulty has hitherto been encountered in reducing this powder into metallic form, on account of the extreme high degree of heat required to fuse it. No ordinary crucibles or furnaces will stand the heat required to reduce it. It has hitherto been reduced only in very small quantities of a few grains only. A small button of the metal was exhibited as a great curiosity at the International Exhibition of 1862. This button was obtained by subjecting about an ounce of the powder above mentioned, for three hours to the most intense heat which could be obtained by means of a powerful gas furnace. The crucible employed was made of freshly burned lime; no graphite or Hessian crucible being found able to stand the heat required.

It will be observed from an article on page 311 of this issue, that this metal has been found of considerable value in hardening cast-iron, although it does not appear to work well when alloyed with steel. In alloying it with iron, it is introduced into the molten metal in a very fine state of division as a mineral. As a metal its alloy with iron would be impracticable, for reasons already given. It is a white brittle metal, not easily oxydizable, and with the exception of gold and platinum, the heaviest known. Its specific gravity is 18 while gold is 19.36, and that of platinum 21.53. Its great resistance of heat would render it of inestimable value to chemists and metallurgists, if some plan of reducing it by chemical reaction could be devised.

From an article in a late number of the London *Mechanics' Magazine*, we are led to infer that this long-sought for desideratum has at length been discovered. That magazine says: "We learn that a Swedish metallurgist has discovered a method of reducing tungsten (wolfram) by which he obtained it at once in a state of fusion, and that ingots of the pure metal, weighing several pounds each, are now on exhibition at Stockholm. We are informed, also, that the cost of obtaining the metal, by the new method, does not exceed a few shillings per pound." If the metal can be obtained thus cheaply, and with no little difficulty as intimated, the discovery is certainly a very important one.

IT'S AN ILL WIND, ETC.—Should the blockade of the Chilean ports be enforced and continued for any length of time, it will greatly benefit the copper interests of California. Nearly all the foreign ore which reaches Swansea comes from Chile. Seventeen ships recently left three different ports of Chile, in one week, with *nine thousand tons* of ore for the Swansea market. Should the blockade be enforced there will be a strong competition for the California ores, which cannot fail to cause an important advance in prices.

PRESERVING TIMBER FROM DRY ROT.

A correspondent from Mormon Island wishes to know if there is any preparation which can be used to prevent the lower end of the flag-staff, in that town, from being destroyed by the dry rot, which is now threatening its destruction. They have already used some preventative; but the symtoms of decay still continue to increase.

We are not acquainted with the nature of the preventative which has been used, or how it has been applied; but suppose some outward application has been made, and that the bottom of the staff is so fixed that, while the moisture of the earth has been kept from reaching the interior of the timber, that interior has been exposed to the action of the atmosphere. In order to arrest the progress of decay, some fluid preparation must be employed which will penetrate the pores or cells of the wood. We know of nothing better than a strong solution of sulphate of copper. It should be applied by boring a number of holes at intervals into the staff, filling them with the solution and plugging them up tight.

A very good coating for the outside may be made by preparing a varnish as follows: Take ten pounds of pulverized chalk, ten of rosin, one of linseed oil, and boil them together in an iron pot. To this preparation add one pound of a strong solution of sulphate of copper, and apply with a brush, while hot, in the same way as paint. This preparation, which, when dry, becomes as hard as stone, has recently been introduced into Germany with much success, for coating wood above ground. It will answer equally well below ground, as it is quite indestructible and entirely impervious to wet. A piece of wood thoroughly covered with this preparation could never decay from dry rot.

WHAT IS DRY ROT?

Some of our readers may not understand the philosophy of dry rot. It is simply slow combustion; the oxygen of the atmosphere unites slowly with the carbon of the wood, causing an imperfect combustion. A full and complete combustion, attended with appreciable heat and flame would result, if the mass was sufficiently large and compact. This condition is fulfilled when the wood is charred and ground to an impalpable powder, and this powder placed in a mass of say 100 pounds, with its surface freely exposed to the atmosphere. So rapid is the absorption of oxygen by charcoal dust, so placed, that it will take fire in a very few days and burn with great heat.

The solution of sulphate of copper, when applied to the interior as we have suggested, envelopes each particle of carbon in the wood with a thin metallic covering, which effectually prevents its union with the oxygen of the atmosphere, and consequently preserves it from decomposition by that active and destructive agent. This is probably better than kyanising, so much used of late years as a preservative of timber, for railroad sleepers, etc. Wood thus prepared will last longer, under ground or in the water, than iron unprotected with any coating, impervious to wet.

THE ore shipments of the Union mine at Copperopolis, for the week ending November 9th, was 641½ tons.

CALIFORNIA TIN ORE.

Some four or five tons of tin ore arrived in this city a few days since, from the Temescal tin mines in the southwestern corner of San Bernardino County, a few miles east of the Los Angelos County line. This ore has been brought here for the purpose of giving the mine a practical test—to learn the actual value of the ore, and test the capacity of our machinery for crushing and concentrating it. The test has proved eminently successful in every particular.

Two or three well developed leads have been opened, from which some thirty tons of ore have been extracted. Out of this the lot received in this city was selected. It has been crushed by Moore's rotary crusher at the Vulcan Iron Works, and separated from its gangue by Hunter's concentrator. The average of the ore received here is about thirty per cent. of tin, as a red oxyd. This ore, after passing through Hunter's separator, has been raised to grade of seventy per cent., in which condition it will be shipped for being worked.

The average of the ore as it comes from the mine—a four foot vein—is fully fifteen per cent. This ore is very readily assorted into two classes, one of which will represent thirty per cent. and the other ten per cent. From twenty tons of the average ore five tons of thirty per cent. can be readily assorted. It is the intention of the parties who now have the matter in hand to proceed forthwith to the erection of crushing and concentrating machinery, on a large scale, at the mine. All the ore will be crushed as it comes from the vein; as Hunter's machine has fully proven its capacity to separate the ore from its matrix, in a speedy, thorough and economical manner.

The mine is located within thirty-four miles of a good steamboat landing, whither the concentrated ore can be hauled at an expense not to exceed $15 per ton. Every facility for an economical working of the mine exists on the spot; while a good fat beef can be bought for $8, or a sheep for $1, and everything in the way of vegetables and grain at a like low rate. The climate is most delightful; corn can be kept in every stage of growth from the blade to the full ear, at all seasons of the year. We think it is safe to predict that these mines, which have lain so long idle, for want of a proper appreciation of their value, or the lack of enterprise to develop them, will soon be made to add a new and important source of industry and profit to the State. The gentlemen who have the matter in hand are old Californians, who have long been interested in developing the mineral wealth of the State, and who thoroughly understand the business which they have in hand.

WORK OF THE DIAMOND DRILL.—Any person who may be desirous of witnessing the exactitude and precision with which the diamond annular drill can perform its work, can have the opportunity of doing so by examining at this office a core taken by it out of a hard rock. We hope soon to be able to give an illustration of the mode of operating the drill, and of the manner in which the diamonds are secured to the same, all of which is exceedingly simple and easily understood.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Sodium-Amalgam for the Reduction of Silver Ores.

BY G. RUSTEL.

A few experiments with sodium-amalgam will allow a judgment as to what can be expected from this new agent—new with reference to the amalgamation of silver ores. It is known that sodium vehemently decomposes water; being converted into hydrate of soda by absorbing oxygen, while hydrogen gas escapes. This ardent desire for combination with oxygen, and other bodies, for which it has a greater affinity than for quicksilver, sodium also retains when dissolved in quicksilver—that is, in the state of amalgam. Its use in the decomposition of silver ores is based on the above property. The following experiments will illustrate the action of sodium-amalgam in this process:

EXPERIMENTS.

1. Sodium-amalgam, when placed in an iron vessel which contains water, and stirred with an iron pestle, will be decomposed almost instantly to quicksilver and hydrate of soda, emitting hydrogen gas. The surface of the iron appears amalgamated.

2. Sodium-amalgam will decompose water in a porcelain cup by itself, more or less rapidly according to the temperature of the water. The rapidity of the decomposition highly increases by touching the amalgam with an iron nail or platina wire. The gas bubbles are created, also, on that part of the nail or platina wire which is out of the amalgam.

3. Sodium-amalgam, under water, in a porcelain cup, covers instantly a piece of sulphuret of silver (silver-glance) or native gold with quicksilver; but there is no reaction by absence of water; a slight bubbling on the edge of the sulphuret is perceived from the moisture which the sodium amalgam draws from the air.

4. Sulphuret of silver, sulphuret of lead or copper, placed on sodium-amalgam, under water, in a porcelain cup, will be attacked vigorously. A portion of the sulphur combines with the sodium; another portion escapes as sulphureted hydrogen, while the silver, lead, or copper, amalgamates. The agitation will stop suddenly, as soon as all the sodium is consumed; a new addition of sodium continues the decomposition of the sulphurets, and to complete the decomposition further additions must be made, until, in presence of sodium, only a slight ebulition is perceived.

5. On sulphuret of silver, sulphuret of lead (galena), chloride of silver, tellurid of gold and silver, the sodium-amalgam acts perfectly, amalgamating all the metal contained in those minerals. Ruby silver (dark) yields only 74.5 per cent. of its silver; the balance turns into a dull, black bulky powder of silver and antimony, with 34 per cent. of silver. Brittle silver ore delivers sulphur to the sodium; turns into black bulky powder like that of ruby silver, with 74 per cent. of silver—but does not yield amalgam. Zinc blende, as well as carbonates, is not attacked by sodium-amalgam.

From these experiments may be deduced the following

INFERENCES.

ad. 1. Silver ores cannot be treated in iron pans with sodium amalgam, as shown in experiment No. 1, for the reason that the amalgam is parted by the iron and water in the shortest time, without any effect on the sulphurets; besides, if a large quantity of sodium should be present, the amalgamation of the same with the iron of the stamps and shoes would take place before the sulphurets could be decomposed.

ad. 3. The use of sodium-amalgam is practicable on gold quartz, in arastras or wooden tubs or barrels. The momentary coating of the gold particles with quicksilver is all that is needed to produce a perfect amalgamation. Dry amalgamation is impracticable.

ad. 4. The quantity of sodium in the quicksilver for the purpose of decomposing sulphurets, or other combinations, must be in chemical proportion to the bodies with which the sodium enters into combination. For example: 23 pounds of sodium will consume 16 pounds of sulphur, or 35 5 pounds of chlorine, or 64 pounds of tellurium, etc. Accordingly, one pound of sodium dissolved in quicksilver, cannot decompose more than 4.5 pounds of silver glance, or 7.9 pounds of tellurid of silver and gold (from the Melones mine), and so on.

ad. 2. The quantity of sodium, as stated in *ad.* 4, is not sufficient, on account of the water, which is likewise decomposed by the sodium-amalgam.

ad. 5. The Comstock ore, which contains a large amount of brittle silver ore, cannot be amalgamated by the sodium-amalgam. The ruby silver of Reese River may be more perfectly extracted by way of roasting.

From the above it is evident that sodium-amalgam will never be used for reduction of silver ores, unless it can be manufactured at such a low price as to allow the profitable use of large quantities. It is also an error to suppose that the sodium is a purifying agent for quicksilver. On the contrary, it causes the reduction and amalgamation of oxides of base metals which cover the surface of quicksilver (which could be easily removed by diluted nitric acid), exposing thus a brilliant surface, which appears alive by the agitation produced by the oxidation of sodium, as seen going on upon the surface of the quicksilver. This is erroneously considered a purifying process.

Sodium-amalgam keeps the quicksilver together so that no minute globules are formed; but as soon as the amalgam is changed into hydrate of soda, the quicksilver appears less alive than before the addition of sodium; consequently, no saving of quicksilver can be expected by using sodium-amalgam. One or two pounds of sodium in a ton of quicksilver will doubtless show a very good result if *gold quartz* is treated with it properly. Half an hour will be more than necessary for the conversion of the sodium; consequently, the charged quicksilver can be used only once as sodium-amalgam.

It is of no use to exaggerate the chemical action of a process beyond its natural limits. The same exaggeration took place with "Ayer's desulphurizing process," which is nothing more than a burning of rock with the aid of superheated steam; the result of which is always oxidation. It may offer a great economical advantage in decomposing the chief part of gold-bearing sulphurets; effecting at the same time a brittle condition of the quartz; but silver ore, treated by Ayer's burning method, is actually spoiled for any other mode of extraction except smelting. Whether steam is superheated, or not applied at all, the result will always be oxidation, more or less perfect; but the process is in no way a desirable preparation for amalgamation. The loss of sulphur and partial over-heating, renders such ore unfit for further rational treatment.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction—A General Review—No. XVIII.

BY PROF. L. LANSZWEERT.

REDUCTION OF ORES BY ELECTRICITY.

The extraction of metals from their ores by electricity, first discovered by M. Becquerel, created, at the time of its announcement much interest among savans, and all others interested in the metallurgical treatment of the precious metals and their ores.

The first assays made in the laboratory, demonstrated the fact that minerals could be reduced, *when in certain conditions*, by electricity. The object of M. Becquerel was to extract the metals from their ores (especially silver) without the use of quicksilver. By this process he hoped to be able to avoid the enormous expense attendant upon the unavoidable loss of mercury, by the processes then in use, and which sometimes amounted to double the weight of the silver obtained.

It was through this discovery that M. Becquerel was also, soon after, enabled to announce the further and important process of electrotyping, or the art of depositing, through galvanic agency, metals, such as gold, silver and copper, upon other substances. By this discovery, the previous process of plating and gilding, by the aid of quicksilver amalgam, was accomplished in a more perfect manner than it could be done by the method previously employed.

Many now believe that by submitting silver ores to a current of electricity, the pure metal may be obtained, free from its gangue, and fitted for commercial purposes. The electro-chemical process, as employed by Becquerel, is not, however, so easy and simple as many of the processes now in use. The reduction of the metals from their ores by this process, as has already been intimated, is possible only under certain circumstances, and in certain combinations. A simple battery cannot be made to operate, practically, on large quantities of ores. The process is applicable only to small assays in a laboratory. All efforts to render it of practical value for working ores on a large scale have proven failures. According to M. Becquerel, in his Treatise on Electricity: "In using a single pair, the quantity of zinc is equivalent to the work produced by it. It is the same for the gases. If in place of one pair, a battery of a certain number of pairs are used, the effect is still the same, with the difference that the exterior chemical work of the voltameter is equivalent to the chemical work taken as isolated. Thus a battery of more than 100 elements, if in each element two pounds of zinc is dissolved, or in the whole 200 pounds, there is produced in the voltameter a quantity of gas only equivalent to that produced by *two pounds* of zinc. The decomposition is no greater or less in quantity than with one pair."

This is an established fact—a hundred pairs or more will have no power to decompose or reduce more metal by the use of the battery, than one pair. The only advantage that would result from this increase of power, would be to simply hasten the decomposition; while the amount of work done or ore reduced would be all the time the same.

The direct reduction of ores by electricity was abandoned by its discoverer, for the reason that this obstacle could not be overcome. Notwithstanding these difficulties, M. Becquerel continued his experiments with persevering energy, and finally demonstrated the possibility of reducing *large quantities* of silver ores, without the use of mercury, by a modified process, which he denominated—

AN ELECTRO-CHEMICAL TREATMENT.

This process was based on the solubility of chloride of silver and sulphate of lead in a saturated solution of chloride of sodium, and that of the sulphate of copper in water. This process will not act upon the metals contained in those ores in their metallic or native state. Before these ores are submitted to the above treatment, their metals are subjected to an electro-chemical preparation, which converts the silver into chloride, and the metallic lead and copper into sulphates. Even when this is done, the treatment requires large quantities of liquid, which involves the construction of tubs or vats of very large dimensions; and these must also be constructed double or one within another, as the reduction of the metal by this process must take place in vessels so arranged.

Space will not allow of my giving any detailed description of the establishment which M. Becquerel constructed at Grenelle, near Paris, where he put up his experimental works, and where he treated upwards of twenty tons of silver ore from Mexico, Peru, and various parts of Europe.

The process of M. Becquerel has the simple advantage of the disuse of mercury, while it presents many objections. It might be useful in any locality where salt can be obtained in abundance, and at a very low price, in comparison with that of fuel and mercury. This process is not applicable to ores containing free silver and gold, as all such must be lost in the tailings; because they cannot be reduced to their chlorides. It does not offer any advantage over the amalgamation by quicksilver in the yield of silver. The reduction works must necessarily be large, and the incessant manipulations require a large amount of labor, to say nothing of the capital required.

CALCULATION OF COST OF THIS PROCESS.

M. Becquerel has based his calculations on twenty tons per day. Now, suppose the value of these tons represent $1,000 (no free metal taken into consideration), what will be the quantity of salt necessary to use to dissolve these $1,000? M. Becquerel informs us that the salt must be at its minimum of saturation, marking 25° Beaume, to be capable of dissolving the chloride of silver. A thousand litres (250 gallons) of this water will dissolve, generally, one pound of silver. One pound of silver, valued at twenty dollars, gives for a thousand dollars fifty pounds weight. Thus, the production of fifty pounds of silver will require 50,000 litres of salt water in its maximum of saturation. According to Becquerel, this quantity must be trebled, because there must be so much left: 1st, in the reservoir, which contains the ore; 2d, in those vessels where the electro-chemical decomposition takes place; and 3d, in the solution to be lixivated. This will make a total solution of 150,000 litres, or 37,500 gallons liquid, to be handled daily. What is the quantity of salt necessary, then, to saturate this quantity of water to its minimum, without which the result would be nothing? The table of M. Becquerel gives us the following: "One litre pure water requires 324.87 grammes (about ten ounces) of salt to mark 25° Banme; 150,000 litres will require 48,750 kilogrammes of salt, or 97,460 pounds."

This process very much resembles one of those complicated pieces of machinery, very nice to look at, and which appears entirely inoffensive, but which, when touched by the finger, takes in the hand, the arm, the head, and the entire body.

A SUCCESSFUL SAN FRANCISCO PROCESS.

Although the above process of reducing ores by electricity did not prove so successful in Europe, still Mr. John A. Scott, an assayer and metallurgist, well known in this city, did succeed in reducing ores in San Francisco, by electricity, in a manner eminently practical and successful.

These experiments were carefully examined into by a gentleman extensively engaged in mining operations in Virginia City. The results, under very unfavorable circumstances, were within from twenty-two to eight per cent. of the fire assay, and so well was the gentleman satisfied with the experiment, that he proposed to Mr. Scott that he should go to Washoe and repeat the same on a larger scale, at the Central mill, where room, power, and help was to be furnished him; he (Scott) to furnish the battery and necessary apparatus connected therewith. Mr. Scott, being assisted by certain parties in this city, accordingly went to Washoe in the latter part of 1862, with a battery sufficient to work from five to six tons per day. After much delay, by reason of heavy snows on the mountains, which kept his freight back several months, the apparatus finally reached Virginia City; but no room, power, etc., could be obtained, according to understanding. The Veatch process was then in operation there, and such influences were brought to bear as to prevent any interference with it by the new process of Mr. Scott. *That process of making calomel* on a large scale was, accordingly, continued for the time, until it was found that the demand for the article was quite too limited for such extensive manufacture, when it was finally abandoned.

Some months afterwards a new attempt was made to introduce the process at Chapin's mill, but for want of the important leverage of the almighty dollar, the parties again failed in this second attempt, and so discouraged was Mr. Scott, that I believe no further attempt to introduce this really meritorious and promising process has since been made.

The process of Mr. Scott was well conceived, and he fully understood his subject. His battery was simple and constant in its action; and his calculation of the cost was founded on data that the result he obtained should be equal to that obtainable from one hundred pairs of Smee's battery, or fifty-five pairs of Daniell's, or thirty-four pairs of Grove's—the expenses of working those batteries being based upon a standard of sixty grains of zinc per hour in each cell.

His decomposing troughs were made of wood, about six feet long, four feet deep, and one foot wide; the two interior opposite sides of which were lined with a conductive agent. The bottom contained mercury. The capacity of these troughs were calculated for a ton of ore reduced in impalpable powder, mixed with water, so as to obtain a pulp. The pulp was kept in constant motion, while the current was passing, and at a temperature of about 170 Fah. These troughs were two fold in their construction: First, as decomposing vessels; and second, as amalgamators.

Under these circumstances there was very little doubt, from previous results, that the reduction of a ton of ore could have been accomplished in less than four hours.

It was the intention of the parties interested with Mr. Scott to replace the battery by an electro-magnetic machine, worked by motive-power.

In the fall of 1863, if I recollect aright, a *redivivus* of reducing silver ores by electricity was gotten up at the Empire mill, I believe, at Gold Hill. Complicated apparatus was erected, but, unluckily, the operators proved themselves entirely ignorant of the first laws of electricity, as the apparatus was so arranged that the electric current passed directly through their pans with the speed of lightning! Their pans were not even insulated from the moist earth, and, consequently, no results whatever could be obtained from their electrical apparatus.

The ignorance displayed by this party of the first principles of the element which they were employing, reminds me of an incident in the same connection which came under my own notice, while residing in Virginia. Mr. S. Kean, of Silver City, who had been employed about two years in compounding medicines, thought he could devise some improvement in the employment of quicksilver for amalgamating purposes. Having learned that amalgamators were much troubled with the quicksilver separating into fine globules (floating), he con-

ceived the trouble arose from its too great *activity*, and proposed the introduction into its mass of *opium*, as a sedative, to keep it quiet—"to make it *sleep*," as he expressed it and thus enable it to catch the precious metals.

ANOTHER ELECTRICAL PROCESS.

Another electric amalgamating process has been published as invented by Mr. Tongue, of Castlemaine, of which the following is a description, given by that gentleman: "The quartz, on leaving the stamp boxes, passes down a shoot twenty-four to thirty inches wide, and fixed at an inclination of forty-five degrees, into a trough containing quicksilver, through which a powerful stream of magnetic electricity constantly passes, obtained from fixed magnets and iron armature, worked by motive power. The passage of the quartz through the quicksilver is regulated by a bridge, which is adjusted by screws and under which the quartz is forced by its own pressure in passing from the machine; thus every particle must necessarily be brought in contact with the quicksilver, when the peculiar action of the electricity upon the quicksilver will cause it to take up every particle of gold that comes in contact with it. The process will apply equally well to pulbling, washing, and other machinery employed in the extraction of gold."

Mining in and about San Juan.

MESSRS. EDITORS:—I propose in this letter to give you a few items with regard to the mines in and about San Juan. The first I visited was the Eureka, situated near San Juan. This claim is owned entirely by San Francisco men. They are working some twenty or twenty-five men, and the mine is now paying well. The next was the American company's claim, now under the supervision of Mr. J. S. Crall, a gentleman whose inventive genius has made a good improvement on the Baux & Guiod pan.

Mr. Crall is now engaged in constructing one of these pans, to get a practical demonstration of it. When it is completed, you and the readers of the MINING AND SCIENTIFIC PRESS will hear more about it. The mines situated in the immediate vicinity of Sweetland's are not at present doing much, on account of some of their tunnels not being low enough, and also from the difficulty arising from conflicting interests; but this will soon be remedied, after which these claims will resume work, and continue to take out their usual amount of gold.

The Yuba Tunnel company, on which work has been continued some eight or nine years, expects soon to be taking out gravel. This company have spent fortune upon fortune in running their tunnel, and at present there are only three of the original owners interested. It is to be hoped that they will soon reap a rich reward, which they no doubt will if they are low enough. The next claim that I visited was the Granite Tunnel company, owned principally by Messrs. Cadwallader, Fogarty & Co., who work their claims to better advantage than any other company in this section. Instead of the old-fashioned blocks for flume bottoms, they have got cast-iron railings, which they fasten on top of the wooden slabs. In this fashion they wear much longer than the wooden bottoms, and save more gold, which should be the study of the miners in this section, who have been heretofore rushing away into the rivers both dirt and gold. I am pleased to see that claim owners here are beginning to find that it is to their interest to work ground slower and surer; and steps are now being made to work the sand and rich sulphurets that have been heretofore lost in this section of country. I forgot to mention that the Granite Tunnel company are cleaning up from six to seven thousand dollars every month, and their expense of running is about $2,500 for the same time.

The Mull & Evans claim, situated north of the Granite Tunnel company, employ eighteen men, run some 300 inches water, with a flume 1,000 feet long, and are now engaged in running a deeper tunnel, their former one not being deep enough. This company have spent some sixty or seventy thousand dollars in running tunnels into their claims, and have only now began to receive any benefits from their ground. I trust they will continue to do so, for they, as well as many others in this locality, have had to work for many years to get deep enough to reach their rich dirt. In many of the claims in this vicinity the richest pay dirt is a kind of cement gravel that should be worked on the same principle as quartz rock crushed and worked with a pan—as at least one-half of their gold is contained in *rich sulphurets* and fine float gold, that is carried off by the heavy currents of water.

The Irish-American, the Kennebec, and the San Joaquin, with many others on this ridge, are now paying well. In French Corral district water is scarce at present, but the miners are busy in preparing for the rainy season, when they will reap rich rewards for their labor, as I am informed that almost all the claims here pay well.

Mr. E. White, of French Corral (who invented the best griping irons yet in use), is now engaged in constructing a large iron pipe, to carry water for the Yuba Ditch company a distance of 1,600 feet, across from one mountain side to another. This is the largest pipe but one in the State, being thirty-four inches in diameter. Mr. White is an inventive genius, and has a new kind of paint for iron piping, which he intends to have patented.

There are many other improvements going on in this section of country, which show that there are energetic and persevering miners here, and that they have got the ground to work on for the next twenty years to come. I will try and keep you posted on this part of Nevada county, as it is beginning to create a stir among scientific miners.

TRAVELER.

[Written for the Mining and Scientific Press.]

Letter from Colusi.

MESSRS. EDITORS:—I arrived at this place a few days ago, and traveled over different parts of this county, including a small portion of the oil region. The first oil well I visited is called the "Antelope Valley Petroleum Company," owned by M. S. Whiting, Esq., President of the company, and other active operations are being carried on by that company, who are now down nearly 200 feet. The force engaged consists of eight men, working with a large spring pole, which is worked by the foot, and the boring process is necessarily slow. A new engine has just arrived, and will be immediately put in operation, which will greatly facilitate sinking. In the vicinity of this well, which is located in a ravine, is a small flow of water, which seems to be entirely covered with oil, which you can skim off with the hand. It burns readily by applying a lighted match. Considerable excitement took place here recently, by a report that another company near the Antelope Valley company had struck a flow of oil, and tin cans and barrels were in requisition to save it.

More recently I have learned the fact that a pocket had been struck, from which a flow of several gallons was obtained, when it suddenly ceased. The sample of this oil brought to town will burn freely in a common lamp, and is said to yield ninety per cent. pure oil. This well, which I also visited, is owned by Messrs. Shephardson, Lightner, and others, and they are only down about fifty feet, boring by horse-power, and sinking about four feet per day. Indications of the most flattering character are observable, and on pumping out the contents the oil will readily burn by holding a burning match to it. The same indications of oil as at the Antelope company are here seen, and everything shows the most flattering prospects. After leaving the Shephardson & Lightner well, I next went to the well known as the Louis Lewis, where the spring-pole process of boring is carried on. The rock in this well, at the depth of 140 feet, becomes suddenly very hard, and boring from that to the present depth, 165 feet, has averaged only four or five inches daily. It is confidently believed that in a few feet more this strata will be passed, and a flow of oil obtained.

The distance from the town of Colusi to these wells is some twenty to twenty-five miles, over a beautiful prairie, on which are scattered bands of horses, cattle, and sheep. Many fine ranches are fenced in, and the past season has produced abundant crops of all the cereals and grapes. I had the pleasure, during my sojourn here, of making the acquaintance of Mr. Alfred Mead, who owns a magnificent ranch about two miles above Colusi, on the river, which is in the highest state of cultivation. He has a fine peach and apple orchard and grapery, and his broad fields are dotted with every description of the finest stock, amongst which will be found a flock of the best-blooded Spanish sheep in California. This flock is owned by Messrs. Mead & Roberts, and has taken the premium at the last Marysville Fair, for size and quality of wool. Mr. Mead assures me that many of them will clip fifteen pounds each, and that of the most silky, beautiful wool I have ever seen on this coast.

The town of Colusi, and county generally, seems to be returning rapidly to its usually former prosperity, after suffering from the remarkably dry years of '63 and '64. Large quantities of grain are being stored for sale or shipment in the future. I intend soon to further visit through the more extensive oil region of Bear Valley, and the celebrated mineral springs of that vicinity, from which I shall again write you. L.

Colusi, November 5th, 1865.

Useful Information.

The Philosophy of Sleep.

NUMBER ONE.

Dr. Whewell, in his Bridgewater Treatise, observes, in reference to sleep, "Man in all nations and ages has taken his principal rest once in twenty-four hours, and the regularity of this practice seems most suitable to his health, though the duration of the time allotted to repose is extremly different in different cases. So far as we can judge, this period is of a length beneficial to the human frame independently of the effect of external agents. In the voyages recently made into high northern latitudes, when the sun did not rise for three months, the crews of the ship were made to adhere with the utmost punctuality to the habit of retiring to rest at nine, and rising at a quarter before six; and they enjoyed, under circumstances apprently the most trying, a state of salubrity quite remarkable. This shows that, according to the constitution of such men, the cycle of twenty-four hours is very commodious, though not imposed upon them by external circumstances."—"No one can maintain, with any plausibility, that the period may be lengthened or shortened without limit. We may be tolerably certain that a constantly recurring period of forty-eight hours would be too long for one day of employment and one period of sleep with our present faculties; and all whose minds and bodies are tolerably active will probably agree, that, independently of habit, a perpetual alternation of eight hours up and four in bed would employ the human powers less advantageously than alternations of sixteen and eight."

"The succession of exertion and repose in the muscular system, of excited and dormant sensibility in the nervous, appears to be fundamentally connected with the muscular and nervous powers, whatever the nature of these powers may be. The necessity of these alternations is one of the measures of the intensity of those vital energies; and it would seem that we cannot, without assuming the human powers to be altered, suppose the intervals of tranquility which they require to be much changed."—"The arbitrary quantity, the length of the physiological and of the astronomical fact, is the same. Can this have occurred otherwise than by an intentional adjustment?"

That sleep, the natural period of the alternation of which with a period of exertion, independent of, yet so curiously adjusted to, the length of a diurnal revolution, Dr. Whewell has shown to be an additional proof of the existence of God, is felt by every one to prove His beneficence,—whether in the soothing influence with which it steals over us, lapping the senses and tired thoughts in forgetfulness, or in the renovation and alacrity of spirit with which we rise refreshed from it.

Repose is not less necessary to the animal frame than exercise. The latter uses, the former restores. It is on their alternation and right balance that strength depends. We can give repose to a strained or weary limb by laying it horizontally and without motion, to an aching joint by a posture of ease and stillness, to the stomach by abstinence,—but not by means exactly parallel to these can we give rest to the mind. It is in vain that in complete bodily tranquility we strive to give composure an quiet to our waking thoughts, their play continues to excite, and disturb, and exhaust;—for mental rest, more is wanted,—for the repose of the nervous system, there must be Sleep.

WHAT IS THE CONDITION OF THE MIND DURING SLEEP.

The first question which presents itself, on entering into this inquiry, is, whether the current of ideas is ever entirely suspended: whether that endless flow of changing thought, which characterizes our waking hours, is even in the deepest sleep stagnant and motionless. There are strong reasons for believing that such complete intermission of mental action does not take place.

We breathe, and the effort probably arises from the call of a sensation, which we so relieve.

We compute the flight of time during sleep, and if we have business to transact that much interests our thoughts, we wake at an unusual hour, before the required hour of waking, and out of the seemingly deepest repose. It is not, however, unlikely, that in this instance, where some kind of conscious observation must have been watching, our sleep has really been imperfect. Opposite as are waking and deep sleep, no two phenomena are more wonderfully chained together by links of insensible transition.

Many have thought that dreams belong to this intermediate state. Lord Brougham, who has given the most definite shape to this hypothesis, observes, after enumerating instances of lengthy dreams, the whole of which, however, must have been comprised in an infinitely short space of time, as they originated in the impression that awoke the dreamer, "There seems every reason to conclude that we only dream during the instant of transition into and out of sleep."

The writer is disposed to adopt the opposite opinion, and thinks that in sleep we always dream; though we lose the recollection of those dreams (by far of course the greater number) which are not from their exciting nature more strongly impressed than common on our minds, or which do not occur so near waking as to be associated at no great remoteness with our waking thoughts. Either hypothesis, however, is equally unsusceptible of proof. What appears to me most to merit attention in this subject is the fact of the non-interference of our dreams, whether occasional or constant, with our bodily or with our mental rest and refreshment. This, I think, is explained by, and explains the objects of, the most curious phenomena of dreaming.

[To be Continued.]

THE SIZE OF DROPS—A CAUTION TO DOCTORS. But here comes a very remarkable question—are the drops the same size whether they succeed each other rapidly or slowly? Most of us say, Yes, if all the other conditions remain the same; but our learned experimentalist says No. He arranged his apparatus (which he calls a *Stalagomerer*, or drop measurer,) in such a way that he could make the drops of cocoanut oil fall from the little ivory ball at intervals varying from one-third of a second up to 12 seconds. He finds that the drops are twice as large and twice as heavy in the first instance as in the last—that is, when the drops succeed each other more rapidly, they are individually larger than when they fall more slowly, amounting actually to double when the difference is as great as that above stated. The Lady Bountiful and Mrs. Nurse need not be troubled with a scientific explanation of this fact—how that it depends on the time which the gravitation of the drop has to overcome the adhesion between the oil and ivory ball; but they are very much concerned in knowing that when they administer medicine "as the fore," in so many drops per dose, the quantity will vary according to the interval of time between the drops. If they hurry, by dropping too much they may administer 30 drops to baby instead of 20, and then—we draw a veil over the consequences. Even medical practitioners themselves are cautioned. "A pharmaceutist who administers 100 drops of a liquid at the rate of three drops per second, may give half as much again as one who measures the succession at the rate of one drop in two seconds." Insomuch that we have not only to be on our guard against taking a drop too much, but must also see that our drops are not immoderate in size. Another caution to the dispensers of drops. Look to the size of the neck and lip of the phial containing medicines; if the vessel is thick and rounded at the spot from which the drops are made to fall, rely upon it that the drops themselves will be individually larger than when a thin lipped phial is used. Professor Guthrie has ascertained this, and he shows how it depends on the adhesion of liquids to solids, as well as upon the cohesion among the particles of liquids themselves.—*Chamber's Journal.*

EFFECT OF PETROLEUM ON THE HUMAN SYSTEM.—Landerer relates the case of a man who swallowed a quantity of petroleum; the greater part he vomited again. It caused a strong burning sensation in the tongue and throat, which were reddened and became swollen. The stomach and bowels also became effected, and slight gastro-enteritis ensued. For several days the urine and sweat smelt strongly of the oils, and the odor was especially strong under the arm pits. The patient was very weak for a time, but recovered.—*Chemical Central Blatt.*

PEAL YOUR PEACHES.—The furz or down upon the outside of the peach is poisonous, and should all be rubbed off before eating them; or, what is better, the peach should be peeled. We have seen several persons with a troublesome rash caused by eating peaches with the skins on. Let a person whose arms are not accustomed to exposure roll up his sleeves and work vigorously for half an hour in brushing the furz from peaches, and if his skin is not proof against any ordinary attack, he will learn something of the poisonous nature of this stuff inside of twenty-four hours. The furz of peaches should never be eaten.

PURE AIR.—Just as we would eat only wholesome food, we should at all times breathe nothing but pure air.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 18th, 1865.

The demand for money continues active, and has been growing rather than diminishing for some time past. Heavy offerings have been in the market this week based upon mining and other stock collaterals; and the requirements of the mercantile classes are still upon an extended scale. Funds on deposit have also been drawn down to a lower point than usual. Good business paper, however, meets with ready takers, and there is capital enough at hand for all the desirable securities offering. But money-lenders are exercising great prudence, and continue to call in loans where a change of collaterals is deemed advantageous, in view of contingencies that may possibly arise. The bank rate of discount rules at 1¼@1½ ₱ cent. per month, but chiefly at the latter figure, with a full line. Upon the street borrowers are paying 1½@2½ ₱ cent. per month, according to security or amount wanted, or the necessities of the case.

Receipts of Treasure from the mining districts, during the week, exceeded $900,000, making an aggregate of some $2,100,000 since the 1st instant.

There was no special inquiry for bullion early in the week, but a fair demand has prevailed the past day or two. Gold bars have been ranging at 840@850, with exceptional transactions at higher figures. Silver bars may be quoted at ¼ ₱ cent. premium to 1 ₱ cent. discount for round lots.

The mining share market continuese xceedingly depressed, and a further decline has been established in nearly every stock on the list. Little or no sustaining power is visible in any quarter, and confidence has for the moment been so effectually shaken that few buyers are found courageous enough to enter the market again for a rise. So far as it is possible to obtain trustworthy information respecting the present condition and future prospect of a number of claims, it would seem that prices could not go much lower, and yet the acknowledged merit of some mines exerts but a slight influence upon their market value. In other words, all dealers appear so panic-stricken, and the demoralization is so complete, that no regard is paid to the intrinsic value of any stock. A slight rally in some shares took place at the close.

Gould & Curry, in view of the decline in all shares, has been tolerably well maintained, and 12 feet were sold within a range of $1,075 @900, seller 30, closing at about $925 asked. The seam of quartz cut by the tunnel on the second station (625 feet from the surface), near the west wall, assayed some $59 ₱ ton, and is regarded as a favorable indication. The body of quartz found in the south drift, and alluded to last week by us, contained only traces of pay metal.

Alpha has been more active and 29 feet were sold, declining from $800 to $590, and then selling at $650. There is no material change to note in the condition of this mine, but arrangements will soon be made to more thoroughly testing the value of the lower level.

Yellow Jacket has been very largely dealt in, and 105 feet were sold, declining from $675 to $500, rallying to $525, and changing hands yesterday at $545@$555. The total indebtedness of this company, October 31st, amounted to $290,677.68. Their immediate liabilities are $138,677.68, and $152,000 will mature in April and July, 1866. The receipts of bullion last month amounted to $144,690, and the actual net profit (after a disbursement of $29,000 for what are termed extraordinary expenses), was less than $5,000. An assessment of $100 ₱ foot was levied on the 15th inst.

Savage steadily declined from $780 to $575, then sold at $585@$600, and was dealt in yesterday at $620. Some 60 feet in all changed hands. Work upon the shaft has continued to interfere with active operations, but the necessary repairs are to be completed to-day, and hoisting will at once be resumed upon a more extended scale than formerly. A large quantity of ore has been disclosed recently.

Crown Point fell from $725 to $640, and closed at $650, within which range small sales were made. Belcher steadily declined from $430 to $285, seller 30, rallied to 300, and closed at $290 asked.

Ophir receded from $392 cash, and $400, buyer 30, to $310, then sold at $325@$330, and was held yesterday at $350. The receipts of bullion this month will probably exceed $50,000, chiefly the product of the 5th and 6th stations of the south mine. Ore has been accumulating recently at both mills, and it is estimated that there are now 400 tons of ore, and 1,500 tons tailings, on hand at the old Reduction Works, which establishment has been treating an average of over 20 tons ₱ day since the 3d inst.

Chollar-Potosi rose from $310 to $320, steadily receded to $250, sold on Thursday at $250, and closed yesterday at $255, at which rates nearly 200 feet in all were sold. The Grass Roots station is said to show considerable improvement lately, from which portion of the mine about 30 tons of ore are now daily taken, yielding $37@$38 ₱ ton. In the Bajazette Ground the old stopes are well timbered up, and the drift north is said to continue in splendid ore, disclosing a deposit 25 to 30 feet in width. In the south end of the 485-feet level operations are still suspended, by reason of the influx of water. All the waste in old workings of the Grass Valley station, it is thought, will do to extract pay ore. There is no change to note in the 3d and 4th levels of the Chollar. The new shaft is now down 495 feet. During the week ending Nov. 10th, 475 tons of ore were sent to custom mills, and 524 tons were sold at $8 ₱ ton.

Imperial has been more active than usual, and nearly 1,800 shares changed hands, declining from $156 to $127½, seller 30, rallying to $140, receding to $132, selling on Thursday at $135@$137½, and closing yesterday at $146. There is said to be no material change in the appearance of any portion of this claim.

Hale & Norcross steadily declined from $210 to $145, and sold yesterday at $145. Empire Mill & Mining Company rose to $170, fell to $150, and then sold at $152½ per share.

Overman fell from $63 to $33, and closed at about $34 ₱ share. An assessment of $25 ₱ share was levied on the 15th inst. Confidence declined from $77 to $50 ₱ share, and closes at about $52.

North Beach and Mission Railroad was dealt in at $49@$47 ₱ share; Fireman's Fund Insurance at $130 ₱ share, and Legal Tender Notes at 68½@68¾c.

The aggregate sales of Stocks, since Saturday last inclusive, amounted to $715,524.

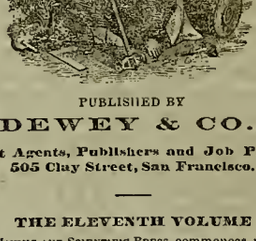
New Volume

— OF THE —

Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).



PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers

505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this Journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News dealers, acting as our agents, will receive liberal commissions.

☞ BOUND VOLUMES FOR SALE.☜

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes) $5.00
Six Months, (one volume) 3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

OFFICE—No. 505 Clay street, corner of Sansome.

DEWEY & CO., Publishers.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Mining Summary.

CALIFORNIA.

The location of valuable quartz leads seems to be more actively and successfully prosecuted at this time than at any previous period in the history of quartz mining, giving most unmistakable indications of general prosperity in mining operations next year. The late rains and present meteorological indications are such as to give assurances of a fair amount of the aqueous element, without which no business on the Pacific coast can thrive. The interior journals, generally, take a cheerful view of things, and confidently predict "a better time coming." Another circumstance favorable to our future prosperity, is found in the fact that capitalists, both at home and abroad, are beginning to evince more confidence in our mines than they have heretofore entertained. The constant and increasing yield of bullion, notwithstanding the depreciation in mining stocks, appears to have opened the eyes of capitalists abroad, and enabled them to look at things in their true light. They no longer regard the fluctuations, from week to week, in the insignificant list of mines which appear in our daily stock reports, as any index of the general condition of the mining interest on the Pacific coast. They have also learned to place a just estimate upon the swindling transactions which are reported from time to time, and to confine such acts, where they belong, to the narrow limit of a few mines which are manipulated by the bulls and bears of Montgomery street. The great mass of the valuable mining interests of this State and Nevada are quite beyond the control or even reach of such men. They are owned and conducted by solid men of means and energy, who are moving steadily along with their works of development, or quietly getting in their heavy dividends, which are paid and pocketed, without any flourish in the daily papers of "Dividends Declared," which announcements are but too often made up of moneys first drawn from the shareholders' pockets, or declared over the heads of creditors of the companies, to whom the mine is mortgaged for nearly or quite its full value.

Yuba.—A correspondent of the Marysville *Appeal* gives the following *resume* of the condition of mining interests in Brown's Valley, which we condense: Mr. George Leland, the new superintendent of the Yuba Mining company, has left for San Francisco, for the purpose of attending to the shipment of the machinery—for an engine and boiler of 20-horse power, pump, hoisting apparatus, etc., in fact all that is necessary to work the claim. Until the erection of a mill of their own, they intend having their quartz crushed in Pennsylvania. The Danneboge, at a depth of about 500 feet, and at a distance of about 120 feet from their incline, have finally reached their former pay-streak, and are now doing well. The Jefferson, at the bottom of the shaft, is about fifteen feet in thickness, and the quartz richer than ever; their next dividend will tell the tale! The Sweet Vengeance, for want of good pay rock, have discontinued work for the present. The company is free from debts, and will soon be able to make another start; they cannot fail to succeed as well as the Danneboge. The Pennsylvania will be able to redeem its ancient reputation as soon as the shareholders come forward and pay up their assessments. The Pacific and Daniel Webster, it is suggested, should again resume active operations, as, in the light of recent developments, they must, undoubtedly, have a valuable ledge.

Trinity.—Mining is brisk in Trinity. At Hay Fork, Mr. Francis took $700 out of one of his claims in a single week. Miners are gathering on the lower river, says the *Journal*, there being some forty or fifty in the vicinity of Cedar Flat already. The population of the county is increasing, and the signs generally cheering.

Butte.—The Butte *Record* is informed that Frank Starr & Co., have discovered a new rich quartz lead near the Forks of Butte. From twenty-four pounds of the quartz taken from this lead, and pulverized in a hand-mortar, the sum of $28 in gold weight was obtained. The parties are now sinking a shaft, with the most flattering prospects.

Nevada.—The *Transcript* says that the quartz miners continue prospecting in every part of the county, from the foot-hills to the summit of the Sierras. Every day new locations are made or new leads opened, while many which were located a few months since are turning out rock which pays from twenty to a hundred dollars to the ton.

Several splendid looking ledges, indicating a new quartz country, have recently been located about two miles beyond Black's bridge, on the ridge between Montezuma Hill and Cherokee. The ledges are numerous, and vary in width from eighteen inches to fifteen feet. The rock is filled with rich looking sulphurets, and a good deal of free gold is found in it. Little prospecting has been done in the vicinity.

The *Union* says that mining operations in the neighborhood of Allison Ranch, Lone Jack, etc., are being pushed ahead with much energy and most flattering results.

It is reported that Jules Friant (the Emperor) has purchased back a one-tenth interest in the mine he recently sold to parties in this city for $450,000. He has been induced to do so from subsequent, unexpected and extraordinary developments below the second level. At this point the ledge is from six to eight feet thick, and there is no reason to doubt that the same uniform richness prevails throughout the whole vein at the depth reached by the shaft. The fact is now established that this new, or three-hundred feet level, is equal in value to the two previously opened. This development more than doubles the value of the mine, and fully justifies the re-purchase by the original owner at an advance.

The Copper Interests of this county, also, still continue to attract a fair show of interest. The *Transcript* says that a San Francisco company is working a claim near McCourtney's Crossing, on Bear river, with excellent prospects. Excellent copper ore has also been found in the vicinity of Bowman's Ranch, in this county. Several claims have been located, in which citizens of Nevada are interested. Excellent copper ore has also been found in the Emerald Isle claim, near Placerville, just on the line in Yuba county.

Sierra.—The *Messenger*, speaking of the ground at Howland Flat, says that the Union claim has now the best tunnel in the county, there being a double-track for nearly 3,000 feet on the main, which is nine feet wide and well timbered. The prospects of this company are considered much improved. The Pittsburg are reported in good pay, and the Hawkeye prospects are improving. Shares are reported as having lately changed hands at figures rating the full share at about $8,000. The Monumental, above and adjoining the Pittsburg, has a tunnel nearly completed, and are in soft rock. They will soon be taking out pay gravel. The Down East and Mountaineer are paying heavy right along, and are rated as No. 1 claims. The French company are down with their shaft and taking out pay-dirt, with flattering prospects. Sugar Loaf is doing well, as usual. John Buckley has sold out his interest in the tailing claims of Fant & Co., to Williams & Cox, for $6,000. The Sierra Tunnel Company, at Cold Cañon, is reported as paying extravagantly. For the last week's run they cleaned up over one hundred ounces.

At St. Mary's district a number of new quartz locations have recently been made. The district appears to be full of mineral, but not yet prospected to any considerable extent.

A correspondent of the *Messenger*, from the southern portion of the county, speaks well of the mines in that section. The works of the People's Gold and Silver Mining company, of New York, are highly spoken of as well managed, and as a profitable investment. There are scores of mines there not yet prospected, but which are, undoubtedly, rich in the precious metal.

Placer.—A shaft has been sunk eighteen feet on the Conrad claim, about one mile west of Auburn, where they have a ledge twenty-eight inches thick, from which a large number of very valuable specimens have been taken. Nearly all the rock shows gold. In addition to the above, says the *Stars and Stripes*, many others who have been prospecting during the past week, have stumbled on rich croppings. There is scarcely a ledge in this vicinity from which more or less rock containing particles of gold, visible to the naked eye, have not been obtained.

Calaveras.—The Copperopolis *Courier* speaks of several new discoveries in that vicinity the previous week.

The *Chronicle* says that Mr. Depew & Co. have completed their 10-stamp mill, on Short Hill. It has been constructed for crushing the dirt taken out of their tunnel. The *Chronicle* thinks that in one year West Point will be proven to be one of the richest mining towns in the State; $48,000 have been taken from Smidth's mill within the past four months, and the mill is but a very small affair at that. The last clean-up was $2,340, from eighteen tons of rock—$130 per ton. Another lot of rock is now being put through this mill, which, it is expected, will yield $250 to the ton.

Dr. Holden, of Stockton, is about to put up machinery upon the Connor claim, near San Andreas.

Tuolumne.—The mountains east of Sonora, says the *Herald*, are filled with prospecting parties, and every day we hear of rich lodes being discovered. Capitalists are rushing from all parts of the States here, buying claims that are already opened, and prospecting and opening new ones. They all say that ere long Tuolumne will be one of the richest counties in the State.

The proprietor of the Mount Maria lode, who has been engaged for the past three years in sinking shafts, running tunnels, etc., has at last struck some very rich rock. A New York company have made him a good offer for the claim.

Amador.—The mineral resources and the wealth of this county, says the *Dispatch*, are now being developed very rapidly. We hear almost every day of some one discovering a rich quartz lode. In fact, there are so many "leads and rumors of leads," that we find it almost an impossibility to keep run of them, and even if we could, our paper is not large enough to notice them separately.

Los Angeles.—The Los Angeles *News* says that the owners of the Mayflower gold quartz ledge have struck the main lode, and that a large quantity of pay rock is in sight. The *News* understands that the company intend erecting a mill at or near their ledge for working the rock; they have plenty of water and an abundance of fuel upon the ground. The mine is within a distance of twenty-eight miles of Los Angeles. One of the richest copper lodes—the Tejunga—in the State lies in the same vicinity, and is yet undeveloped.

NEVADA.

The leading silver mines of Washoe are yielding largely, yet the stock market becomes more and more demoralized. Bad and corrupt management is what's the matter.

The Gold Hill *News* says that the richest quartz mines yet discovered on this coast, eclipsing in richness even the famous Enterprise lead, are said to have been just discovered in the hills above Emerald Bay, near the Placerville route, between Yank's and Strawberry Valley. This discovery has created a great excitement throughout the country around, and people are leaving their regular avocations and rushing in from all sides to get a location in the new mines.

A new and important enterprise, of a somewhat novel character has recently been started in Dayton. Messrs. J. D. Andrews & Co., have purchased a large space of ground, covering an area of about forty lots, on which a reservoir will be constructed for the collection of tailings from mills up the cañon. The reservoir, when completed, will be of about two million tons capacity. These tailings are to be worked by a process that the proprietors feel confident will be successful.

The Chollar-Potosi have nearly completed their new works. When these works are entirely completed their heavy expenses will be greatly lessened, and shareholders may look out for dividends. Their shaft is now down 500 feet, and they have commenced a drift westward to strike the ledge. The company is now running out all their rock through the Potosi tunnel. The *Union* judges from the number of teams seen at the dump that they must be driving a paying business.

A rich strike was made a few days since, in the vicinity of the Manhattan mill, near Washoe City, where a man having nothing else to do commenced prospecting beneath the ashes of a camp fire. His labors were rewarded by finding a large lot of amalgam, some ten inches below the ashes, worth about $700. An employee in some neighboring mill had probably been stealing small lots of amalgam, as opportunity presented, and had *cached* at the spot where found. A similar deposit was once before found near the same place.

HUMBOLDT.

The *Register* says the Eastern companies still continue to make investments in the Humboldt mines, all of which are making immediate preparations to proceed with an active development of the same. When surface preparations are properly made before winter sets in, the snow and cold will be no hindrance to underground operations. The *Register* has heard of another large purchase in Sierra District by a New York company. A part of the money has come, and another portion is on the way. Agents of Eastern capitalists arrive almost daily, to arrange particulars of purchase and make preparations for work. All seem well pleased, except those parties who were bilked on the Pinewood district.

It is to be hoped Eastern companies will be a benefit to the State. They will act upon a different policy from that pursued by the San Francisco capitalists—their energies will be exercised mainly in working the mines, and not in working the stock market. Many of these Eastern companies are composed of steady-going men, who have made fortunes in mercantile, manufacturing and commercial pursuits; and now invest some of the surplus revenue which trade thrift has brought them in mining enterprise—a no less legitimate enterprise than the ordinary trades, when properly pursued; but involving larger risks, with the chances of correspondingly larger gains. These men have no taste for stock jobbing. They prefer to work the mines, and await at home the arrival of their gains in honest silver bricks. Having them in such esteem, we welcome to our bleak mountains these old gentlemen, says the *Register*, with the greenbacks.

The Esex mine, on the Neptune series, is going ahead. The new owners in the East are sending out funds, and the work of development continues. A ledge of 2½ feet wide is found at a depth of 12 feet in the new shaft, and the ore remarkably rich. If it proves a permanent ledge, and anything like what this leads the owners to hope, it will be a great mine.

A quartz mill is wanted in Star Cañon. A correspondent of the *Register* says: There have been several attempts made to build mills, and three have been put up in the canon—costing in the aggregate nearly $100,000; and yet we are without a mill. The De Soto has just suspended operations, for the simple reason that they can get no ore crushed. The ore they have been taking out would pay all expenses, and a handsome dividend besides; and to run the mine all winter without getting any of their rock crushed, would take at least three assessments. The trustees, therefore, ordered the work stopped. This is one version of the reason of the stoppage; there may be other reasons. The mine to-day is looking better than ever, and just a few days before the work was stopped they struck a vast deposit of very rich mineral. All the other claims are pushing ahead lively.

ESMERALDA.

The Esmeralda *Union* says that the Empire and Bodie mill cleaned up, a few days since, over $8,000 from a crushing of one hundred tons of ore from the Homestake claim, an average of over $80 per ton. The *Union* is informed that they have between two and three hundred tons more out.

A bar worth $4,000 arrived a few days since from Kearsarge district. The mines down that way are beginning to "shell out." The Silver Peak and Red Mountain mines are also producing well, and are beginning to ship considerable quantities of bullion.

OREGON.

The Jacksonville *Sentinel* says that active efforts are being made to give a thorough and practical examination of the gold and silver bearing quartz veins about Jacksonville, with improved machinery. That paper thinks that favorable results will be reached, for certainly no placer mines in the country have been richer than those on Jackson creek.

IDAHO.

There appears to be much reason to believe there is some foundation for the extraordinary reports which recently reached here of some extraordinary silver developments about one mile south of Oro Fino, and near to the Empire ledge, belonging to Col. Fogus and others. The new discovery has been named the Poor Man's ledge. The ledge is said to be about seven feet wide, can be traced for a long distance on the surface, and carries a streak through the centre about eighteen inches wide, so well filled with native silver that it can be cut with a knife. A large amount of rock is said to have been taken out. Five tons have been taken to the Sinker mill, which is said to have yielded *one ton of bullion?* It is also said that rock to the value of $600,000 has already been taken out and that there is a plenty more left equally rich. We shall look with much interest for further developments.

An Association of Mining Superintendents.—The mining superintendents of the mines on the Comstock lode in Virginia City and Gold Hill have held a preliminary meeting for the purpose of organizing themselves into an "Association of Superintendents" for the furtherance of the development of the mines of Storey county. At the first meeting, which was very generally attended, Mr. Wm. Blanding was elected temporary President, and N. A. H. Ball, temporary Secretary.

On motion, a committee of seven were appointed to draft Constitution and By-Laws, to be presented to an adjourned meeting. Messrs. P. S. Buckminster, Chas. Foreman, Harvey Beckwith, John B. Winters, Wm. Blanding, L. Janin and John Nugent were appointed such committee.

On motion, a committee of two were appointed to select a proper room for the use of the association and report place and terms at next meeting. Messrs. Peachy and Graves were appointed.

Meeting adjourned to meet on call of Committee on Constitution and By-Laws.

Mechanical.

MOLECULAR CHANGES IN METALS.

In our last issue we gave some important facts with regard to the molecular changes effected in metals, generally, by heating, rolling, hammering and annealing. We now propose to note a few facts with especial reference to the alloy known as brass.

The term brass is applied to any yellow alloy of copper, with zinc, tin, lead, antimony, etc.

Brass intended for smelting should be entirely free from antimony, as the slightest presence of that metal renders it brittle, and liable to crack.

Brass intended for turning, in addition to copper and zinc, should also contain from 2 to 2.15 per cent. of lead in its composition. The addition of the lead causes the turnings to leave the tool easily. It should be introduced into the crucible which contains the melted brass after it has been taken from the furnace.

Brass for engraving upon, as for door-plates, etc., should contain a very little tin, as that metal gives a crispness to brass, and causes it to break up short under the graving-tool. Brass for braziers should not contain less than 56½ per cent. of copper.

Molecular Changes.—Brass wire becomes very brittle, if subjected to vibration in a state of tension, and sometimes when subjected to long continued tension alone. If subjected to great tension and rapid vibration, it will sometimes become almost as britile as glass, in the course of a few weeks. Brass chains and rods used for supporting objects, such as chandeliers, etc., have often been known to break without an assignable cause other than a loss of their tenacity. In such cases, on examinatioa, the brass will be found to be very brittle, much more so than when first put in place. This tendency to loss of tenacity is also common, but in a much less degree, to most or all of the metals and their alloys.

Brass, when used as bolts, sometimes undergoes a very singular molecular change, known as exfoliation—the metal, on the exterior, becoming more or less separated into concentric layers or laminæ, leaving a solid, cylindrical nucleus within.

Brass wire, when composed of 75 per cent. of copper, and 25 of zinc, if wire-drawn, and taken directly from the drum on which it has been wound in that process, and immediately subjected to the process of annealing, will be almost as brittle as glass; but if, previous to annealing, the coil, as taken from the drum, is subjected to strong and repeated concussion, it will retain its primitive condition of tenacity. This concussion may be applied by taking hold of one part of the coil with the hands, and raising and striking the other heavily upon a beuch or other firm object. This, perhaps, is one of the most siagular molecular chauges of metal known.

"*Spuey Metal.*"—Brass castings, after being turned off smoothly, and subsequeutly lacquered, are often noticed to be soon after covered with little green spots of efflorescence. This is produced in the following manner: In castiug, minute, microscopical cavities will sometimes occur immediately below the surface, and which may not be entirely removed by the turning tool. These cavities are probably caused by minute bubbles of air. In dipping the casting into the acid, previous to the lacquering, it is easy to conceive that a small amount of the acid may penetrate these cavities in such a manner as not to be removed by the subsequent washing in water; so that nitrates of zinc and copper would thus be formed, by the acid contiauing there. aad soon after the lacquering process, their efflorescence would break through the film of lacquer, and show itself on the surface, thus producing what is techuically known as "spuey metal."

Steam Jets.—The use of steam jets to increase fire or furnace drafts is nothing new. Their use can be traced as far back as the time of the ancient Romaas, who are known to have employed jets of steam, both directly into the fire, and also above the fire into the flue or chimney, to increase the draught. Very likely the first application of the priuciple might have been employed even auterior to the Romans.

Tungsten (Wolfram) Alloys with Iron. Some six or eight years ago much interest was excited with regard to the use of tungsten or wolfrum as an alloy for hardening and improving steel. It was first introduced by an Austrian Steel Manufacturing Company. It was thought by some that it would revolutionize the working of cast steel. Mr. Mushet, of England, obtained nine patents in one year for forming steel alloys with this metal; and the opinion was quite prevaleut that the new steel alloy would last three or four times as long as the best English steel. Now no well informed persons believes in tungsten steel. But there is ground for the idea that the addition of tungsten to cast-iron improves the quality of that metal. Some very careful experiments have quite recently been made at the French marine foundry at Nevers, which appear to show pretty conclusively that cast-iron has its tenacity increased about one-sixth by the addition of about two per cent. of tungsten. The tungsten is added to the iron in its mineralized condition of wolfram; metallic tungsten not being available. For some facts with regard to the mineral "wolfram," see article in another column.

The Stones of the Temple.—The marble stones which composed Solomon's Temple were said to be forty cubics long, twelve thick and eight high. Supposing a cubic to be eighteen inches, which is the lowest estimate, they would be sixty feet long, eighteen feet thick, and twelve feet high. And supposing a cubic foot of marble to weigh 2,707 ounces one of these stones weighed 2,752,038 pounds and 12 ounces. And supposing one man to be able to raise 200 pounds, it will require 13,760 men to raise one of these, and also a little boy who could raise 38 pounds 12 ounces. And suppose one man to require a square yard to stand upon, it would require two acres, three rods, eleven perches and twelve yards for them to stand upon while raising it, besides a place for the little boy to stand. What floats must have been necessary to carry them across the sea to Joppa! And what kind of teams, as well as wagons, do you suppose they had to carry these stones from Joppa to Jerusalem? And what skill was necessary to square and dress these immense stones, so that when they were brought together they fitted so exactly that they had the appearance of being solid stone.

New Style of Drill.—Mr. Jennings, Superintendent of the Jenning's Petroleum Company, who came up on the steamer, brought with him some additional machinery for that company's well, among which, we noticed a new style drill, recently patented, if we remember correctly by C. A. Fargo. It represents two ordinary drills so placed as to present the faces crossing each other at right angles—or, in other words, to a main drill are secured two pieces or flanges laterally by a screw or screws passing edgewise eutirely through these pieces and through the main drill, making in reality two drills, arranged as before stated. This is made to couple with a sand-pump of heavy, strong material, from which projects near the bottom a steel jaw intended to do the work of the reamer. When the drill and pump descend, this jaw, resting firmly in its position does its work, and when they are raised it yields to the pressure of the walls of the well, and offers no impediment to that operation; during the process of drilling and reaming, the sand-pump is performing its allotted duty by cleaning up after the drill and the reamer. When this is full the whole is raised and the pump relieved of its load by means of a "door" opening just above the valve. It remains to be proved with what efficiency this will perform the work for which it is iatended.—*Humboldt Times.*

Atmospheric Pressure as a Source of Mechanical Powers.—The *Journal of the Franklin Institute* has a series of articles under this title, supposed to have been written by Mr. Ewbaak, formerly Commissioner of Patents, advocating the combination of a high-pressure engine with a very low pressure engine. the same steam to go through both engines. It is also proposed to drain the condenser by a pipe descending thirty-six feet below the bottom of the condenser, and dipping into a vessel, so that the water should not run entirely out of it. A small air-pump would then serve to keep a vacuum. The use of ice is recomended for condensation because "the advantage of ice for internal condensation arises from the fact that air combined with ordinary water is discharged in the act of freezing, hence there would be little air to pump out."

The use of the term "horse-power" is very common, yet few, except good mechaaics and eagineers, attach a definite meaniug to it. It means the power required to lift 33,000 pouuds avoirdupois one foot high in one minute.

Curious Facts About Cutting Timber. Cut timber from September to December, and you cannot get a worm into it. October and November are perhaps the best months, and sure to avoid worms.

You cut from March to June, and you cannot save the timber from worms or borers. May used to be called "peeling time," in my boyhood; and much was then done in procuring bark for tanneries, when the sap is up in the trunk and all the pores are full of sap; whereas in the fall and early in the winter these pores are empty—then it is time to cut, and there will be no worms.

When you see an ox-bow with the bark tight there are no worms, no powder post, and you cannot separate it from the wood, and what is true in one kind is true in all kinds of timber, and every kind has its peculiar kind of worm. The pine has, I believe, the largest worms; and these worms work many years. I have found them alive and at work in white oak spokes that I knew had been in my garret over twelve years, and they were much larger than at first; they do not stop in the sap, but continue in the solid part. I do not think of buying timber unless it is cut in the time above alluded to.

I have wondered that there has not been more said on this subject, and it is one of great importance, even for firewood and especially for building, etc.—*Exchange.*

Production of Steel by Means of Gases. M. Aristide Berard brought before the Academy of Sciences, at its sitting of June 26th, his method of forming steel by means of gases. It consists in alternately oxidizing and reducing cast-iron in a furnace suited to the purpose. The oxidation is produced on one portion of the cast-iron, by the introduction of atmospheric air, and the reduction on another by a mixture of hydrogen and carbonic oxide, previously freed from sulphur. After twelve or fifteen minutes the processes are reversed, the portion subjected to oxidation being submi ted to reduction, and *vice versa*. Any oxygen evolved is absorbed by burning coke placed in a suitable position. When this alternate action is found by trial to have been continued long enough, the operation is stopped, decarbonation being the terminating process. During oxidation the bases of the metals proper and of the earths are oxidated—the sulphur, phosphorus, etc., form acids, and escape. During reduction, the iron is brought to the metallic state, and the earths separate as scoria, any remaining sulphur, phosphorus, etc., being eliminated as acids, and some carbon is restored to the iron. A high temperature is produced during oxidation, a low during reduction. Ten or twelve tons are manipulated at each operation in the establishment which has been formed by the inventor—and the steel produced is said to have all the properties of the ordinary kind.

Strength of Materials.—It is a remarkable fact, that one of the most abundant materials in nature—iron—is the strongest of all known substances made. Made into the best steel, a rod one-fourth of an inch in diameter will sustain 6,000 pounds before breaking; soft steel, 7,000 pounds; iron wire, 6,000 pounds; bar-iron, 4,000 pounds; inferior bar-iron, 2,000; east iron, 1,000 to 3,000 pounds; copper wire, 3,000 pounds; silver, 2,000; gold, 2,500; tin, 300 pounds; cast zinc, 160 pounds; sheet zinc, 1,000 pounds; cast lead, 55 pounds; milled lead, 200 pounds.

Of wood, box and locust, the same size, will hold 1,200 pounds; the toughest ash, 1,000; elm, 800; beech, cedar, white oak, pitch pine, 600 pounds; chestnut and soft maple, 650 pounds; poplar, 400 pounds. Wood which will bear a very heavy weight for a minute or two will break with two-thirds the force actiug a long time.

A rod of iron is about ten times as strong as a hempen cord.

A rope of an inch in diameter will bear 2½ tons, but in practice it is not safe to subject it to a strain of more than about one ton. Half an inch in diameter, the strength will be one-quarter of an inch, one-sixteenth, and so on.

New Fire Annihilator.—A number of scientific gentlemen in England, have been witnessing experiments at Mr. Willing's premises, King's Cross, with a new fire-extinguisher, the patent of Dr. Carlier & Mr. Viguon. A huge fire was lighted three times, each more powerful than its predecessor, and a man with one of the machines, it is said, completely mastered the conflagration in a few seconds. The machine is portable, and costs from £4 to £6. It is always charged; may be slung upon a person's shoulders; and can be used by a child. The charge simply consists of a large seidlitz compound; and, the vessel being air-tight and capable of bearing a pressure of 150 lbs. to the inch, the liquid containing the gas can be projected to a considerable distance. The experiments were deemed satisfactory.

The Marysville *Appeal* urges the establishment of a woolen factory in that city

Copper Sme'ting in Plumas.

High up in the mountains, to the northeast, in the upper part of Plumas county, there seems to be a large region bidding fair to become remarkable for copper and perhaps gold. There are many copper veins, of which only one is being successfully worked, called the Cosmopolitan, in Genesee Valley, where a good set of smelting works, costing thirty thousand dollars, has been completed under the control of Mr. I. C. Clapman, where, on the average, about six hundred pounds of pure copper are smelted daily. Here the melted copper is not drawn off into moulds as at Copperopolis, but, as it runs from the furnace into a vat kept hot by a surface of burning coals, it accumulates till the vat is full. Then the coals are removed, and the worthless slag soon cools in a crust and is then thrown away; next successive crusts of matt, of about fifty per cent. of copper are thrown off at the rate of three for each minute. This is kept for a second refining process. Next the pure copper appears at the bottom, and is known by the fact that no crust will form on the surface when the whole is left to cool in a mass of pure metal. The freight upon pure metal to San Francisco, is comparatively light, where it is sold at a good profit to all engaged in the work. About four miles above this another set of works is also being put up, and fine copper mining times, during the coming year, are anticipated. The scenery of this region here, in upper Plumas county, is indeed grand, magnificent; vast granite ridges rise two, three, or even four thousand feet high, exceedingly steep, often impossible for a horse to ascend straight, and even very difficult for a man; generally covered with a good growth of pine timber, from the bottom to the top. The summit of these ridges may be a mere back-bone, of a rod or a few rods across, with each side alike precipitous, though at times this highest land will widen out to acres in extent. In the deep cañons below, a little pure stream of water for miles in a rocky channel destitute of any level land upon its bank; then again these steep mountain sides recede back a little from the streams and leave a beautiful, smooth, even, grassy valley, a very few rods or a few hundred rods across, and two, three or six miles in length, crooking and winding with the stream, among the towering heights hanging over them, the most lovely imaginable in contrast with the rugged mountains, shutting them in. All these valleys are now taken up in farms or dairy ranches, and are held at a high price by their owners.—*Pacific.*

The Idaho Tin Discovery.—The editor of the Owyhee *Avalanche*, who took a tour through the mines of that region, writes to his paper as follows of the late report of the discovery of tin ore in Indian creek:

This discovery is no humbug gotten up for the purpose of speculation or excitement, but is a fact. All the miners that have worked the placer claims within certain limits recollect the presence of the peculiarly shaped pebbles in their claims, and it is believed that it may be found in paying quantities. It is not a little singular that these mines have been worked for two years without any one of the miners knowing that they were valuable. The different degrees of abundance in which the ore is found in different places along the creek indicates that a mine of the stuff may be found somewhere about the north end of Gold Mountain. The ore is very rich, yielding about seventy-five per cent. of pure metal. Col. Fogus produced a little tin brick this afternoon, about the size of a five franc piece, from two ounces of the ore. Much of the metal was lost as he succeeded in reducing the ore after trying two processes in vain.

Dirt Crushing.—Messrs. Depew & Co., says the Calaveras *Chronicle*, have just finished their 10-stamp mill, to crush the dirt from their tunnel. Experience, says the *Chronicle*, has proved that the clayey dirt taken from some of the tunnel claims in that neighborhood pays far better by being worked in a mill than by any other process. A hundred mills or more may be employed, in the various parts of the State, to work gravel that is now being washed, and at a vastly increased profit over the mode of simply washing with sluices. Experiments in Nevada county fully proved this years ago.

The Dalles *Mountaineer* says a couple of miners came down from the John Day mines some days since with thirty-seven pounds of gold, the result of their industry during the past summer.

Smoke from burning woods in Canada has been so dense as to prevent navigation on the St. Lawrence river.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

IMPORTANT EXPERIMENT.

The Grass Valley *National* gives the following account of an important experiment recently made at the Empire mill, in that town, to test the different results between working sulphuret sands by the usual process of saving fine gold, and then concentrating and submitting the sulphures to a chemical (chloration) process; or submitting them to a thorough pan triturntion process (similar to that to which silver ores are applied), after the free gold has been first taken out.

Heretofore, says the *National*, this company have concentrated the sulphurets, and sold them, to be worked by chemical process. The experiment was tried on a lot of blanket-washings, weighing 2,700 pounds; and after saving the gold by the usual process, the tailings were run through the pans, instead of separating the sulphurets. The amalgam cleaned up in the pans amounted to fifty-two ounces, which retorted $285. It is estimated that the tailings would have yielded a quarter of a ton of sulphurets, which would have sold for fifteen dollars. Here was a clear saving, by the use of the pan (Baux & Guiod's), of $270.

Captain Lee would be doing a good service to the mining interest by carefully repeating this experiment, for verification. We would suggest that the "blanket-washings," after being treated by the "usual process" of saving the free gold, should be divided into two equal parts, carefully sampled—one half submitted to the pans, and the other half worked by the chloration process, and the results carefully noted.

SODIUM-AMALGAM.—Elsewhere in our columns, to-day, will be found a very interesting article giving the result of some experiments in the use of sodium amalgam. Of course the subject is far from being exhausted; but several very important facts are presented in which our mining readers will be particularly interested. The high standing of the writer, Mr. Kustel, as a practical metallurgist, entitles his experiments and observations to a careful consideration, although it is possible he may have placed too low an estimate on the utility of this newly discovered agent for the amalgamating room. We shall probably soon be able to lay the results of more extended experiments before our readers.

WE would call the especial attention of our mining friends, who may be in need of the aid of a mining engineer or expert, to the card of G. Kustel, which will be found in another column.

A NEW WINE PLANT.

An entirely new kind of wine has recently been produced in several localities in New York and Connecticut from a plant known as the "Linnæus Plant." In appearance it much resembles the pie plant; but is quite dissimilar in its chemical proportions. It will flourish readily on any ordinary corn land. Set out in the fall, it is ready to be gathered for wine-making the next July or August. All machinery needed for extracting the juice is a common cider press. It appears that certain parties, the past season, manufactured 4,006 gallons from 3,264 plants, besides obtaining from the same plants 20,000 settings for new plants next year.

The New York *Tribune* says, an experienced horticulturist, who made 1,500 gallons, declares that the wine, in many of its qualities, "is superior to any ever before manufactured in this country or imported from Europe." The plant is being extensively introduced by a number of prominent citizens of the State of New York. As high as $2.50 is said to be offered for the wine, and United States District Attorney Dickinson, Judge Griswold, Congressman Hotchkiss, and other prominent citizens of Binghamton, declare that the wine possesses "a beauty of flavor and a delicacy of taste seldom, if ever, excelled by the best Sherry wines of Europe," and that the plant cannot fail "to be a great and sure source of revenue to all who engage in its cultivation." Would it not be well for some of the California wine-growers to introduce the plant into this State?

WINE MAKING IT NAPA COUNTY.—St. Helena is situated near the head of Napa Valley, seventeen miles north of Napa City, and eight miles south of Calistoga Springs. At this point the valley is comparatively narrow, being only from three to four miles in width from the rugged range on the east to the hills skirting the west. It is this location which is claimed to produce some of the best-flavored and strongest wine in California, partly from the volcanic formation of its soil, and partially from the remarkably even temperature of the climate, which not only adds to the uniform growth and flavor of the grapes, but is an important favor in the critical period of fermentation in wine making. There are many fine vineyards in the neighborhood of St. Helena, some of which, doubtless, furnish the city of San Francisco with hundred of tons per annum of the sweetest grapes which enter her markets. Among the vintages devoted to wine-making, we visited that of Dr. G. B. Crane, a gentleman of unlimited hospitality, and fine scientific attainments. He is ardently and intelligently devoted to wine and grape culture, so much so, in fact, as to remind us that the grape and wine culture of our country is certainly worthy of scientific and professional attention. Dr. Crane has some 3,000 gallons in his cellars of the vintages of '62 and '63, which he is confident, from its strength and purity, will bear transportation to New York or Europe better than wine manufactured in any other district on this coast. He has now forty acres of vines under cultivation, thirty of which will be bearing next season. Many foreign varieties are embraced in his collection. This year's manufacture will comprise about 6,000 gallons, entirely from the California grape. Young vineyards are a noticeable feature of this locality, a district which we think, is destined to become notorious for its wine-growing qualities, as it already is for its rich grain fields.

COMMENCEMENT OF THE RAINY SEASON.—The rainy season has commenced in earnest. The amount of water which has fallen during the past week has probably been quite sufficient to enable the farmers to plow, and with a little addition, which is even now coming as we write, will enable the miners in the dry diggings to wash the dirt which they have heaped up during the summer. The prospect is also fair that the rivers and ditches will soon be flowing full, and giving life and confidence to all branches of industry. The rains have been general throughout this State and Nevada.

San Francisco Mining Machinery.

The Reese River *Reveille* has a compliment for San Francisco machinists, which that paper places before its readers in the following manner:

A few days ago, Mr. Whitlatch, the discoverer of some of the best mines about Austin, but who has been living in Montana for two years past, arrived back in Austin, on his way to San Francisco to buy a quartz mill. He told us he could get a mill from the Eastern States much cheaper, and the cost of transportation up the Missouri river would be very light; but, from what he had seen, he was satisfied that one California quartz mill would outlast and do better work than two or three of the Eastern States mills, and for that reason he thought it economical to buy his mill at San Francisco and haul it home by way of Austin.

Apropos to the above an Idaho correspondent of one of our cotemporaries writes that a large number of parties in that Territory—a majority of them—obtain the machinery for their quartz and other mills from Chicago, freighting them overland. The quality of the machinery procured in Chicago is not so good as that procured in San Francisco, but the cost of freight from the former city is so much cheaper than from the latter, that it becomes a matter of great saving for the Idaho miners to make their purchases on the shores of Lake Michigan, instead of on the shores of the Pacific. The distance from Chicago to the Idaho mines is fully fifteen hundred miles; while from San Francisco it is less than seven hundred. Yet freight can be transported over the former long and tedious route much cheaper than it can over the latter short one. With improved facilities for transportation, San Francisco machinery will eventually supersede Eastern work in all our Pacific mines.

CORRECTION.—In the notice of Mr. White's Desulphurizer, which we made last week, an error occurred as to the amount of work which the inventor claims the machine is capable of accomplishing. For twenty-four tons in twenty-four hours, read forty-eight tons in twenty-four hours. Mr. W. claims that from actual experiment he can thoroughly desulphurize at the rate of two tons per hour of running time. A shovelfull of ore discharged from the hopper into the machine, when running at its proper speed, ordinarily passes through in eight minutes—from six to ten is the general average; the time varying somewhat with the character of the ore. Mr. White may be seen for consultation every day between the hours of twelve and one o'clock, at room No. 10 Government House.

THE MEADOW LAKE MINES.—It is now ascertained, says the Grass Valley *National*, that the Enterprise is the leading mine in that region, and every blast that is made in the ledge shows richer ore than the above. This mine more resembles a huge quarry than a ledge. Some of the old locations, the Excelsior, Pacific, Wisconsin, Parker, and Reporter, are being worked, and show much better in mineral than has ever been expected by the owners. Of the new locations, some have developed fine ledges, which may prove equally as rich as the famous Enterprise.

THE MOSCOW-OPHIR SUIT.—The compromise agreed to by the Ophir and Moscow companies has been abandoned, in consequence of a dispute that arose when the papers were to be signed. The consequence is that the Moscow people are preparing to prosecute their suit.

RAILROAD TO GRASS VALLEY.—The *Union* says that Mr. Hart, a popular railroad man, is making preparations for the survey of a road between Grass Valley and Colfax, with the intention of testing the feasibility of a railroad between the two places. Already many of our prominent citizens have subscribed towards the survey.

PRICE OF PASSAGE.—The P. M. S. S. Co.'s steamship Constitution sails to-day. The rates of passage are: First cabin, outside rooms, $210; do. inside rooms, $157.50; second cabin, $90; steerage $60.

FROM THE OIL REGIONS.

The Humboldt *Times* says that a large oil spring has been discovered near the Big Bend of Mad River, on the land owned by Capt. Fauntleroy, of the steamer Del Norte. This is the first discovery of the kind made in that vicinity, although the shale and sandstone formations are known to exist there much the same as in the localities that are now attracting attention, and where operations are progressing. The Blue Slide and the Humboldt Butte Petroleum companies are located in lands in the immediate vicinity of Big Bend of Mad River, both of which are preparing to sink wells.

This locality is upwards of twenty miles north of any previously discovered oil springs in that county, and some ten or twelve miles to the north-east of Eureka. The Del Norte, on her last upward trip, took up a set of boring tools for the Buckeye Petroleum company, whose land lies about one mile east of the Union company's well; another for the Mattole Creek Petroleum company, and a third for the Eel River Petroleum company.

The *Times* further says that rumors are rife of new developments in the vicinity of the Noble well, and understands on good authority that a bid has been made for the Union well for one year, of $10,000. Work is progressing satisfactory at the Oil Creek Co.'s well.

SANTA BARBARA.

With regard to the prospects in this county, the *Gazette* says that although in the throe or four wells which are in course of operation a flow of oil has not yet been obtained, nevertheless the amount of crude oil which runs to waste at the surface, is so enormous, that it would seem to be impossible that there should not exist below an immense deposit. Between the town of Santa Barbara and the boundary of Los Angeles county, there are now perhaps one hundred and fifty new comers, in the employ of Eastern capitalists, actively boring for oil. At San Buenaventura, where the first oil enterprise was started, years ago, by Mr. Gilbert, they are now shipping crude oil by the hundred barrels to San Francisco, for refinement. This oil is the natural yield of the springs without boring. In the valley of San Buenaventura alone, hundreds of barrels of crude oil have run to waste heretofore daily, being the natural flow of the oil springs existing there.

A somewhat extended notice of the oil interest in Colusi county will be found in the letter of our correspondent from that region, which will be found in another column.

OIL IN LOS ANGELOS.—The Los Angelos *News* says that the machinery, for the Pioneer Oil Company's works, near that place, was received by the last steamer. It is to be hoped the company will have better success in their second trial. If the work of boring could be resumed, with new and more powerful machinery, from the depth at which they left off working, oil would no doubt be reached in a very short time. We believe that oil in abundance underlies the whole face of the earth in this vicinity; the above mentioned company have labored under great disadvantage for want of experience, and throughness in conducting the first *experiment*.

THE OIL SEEKERS of Indiana are not meeting with as good success as they had expected, or has attended the explorations in Ohio and Kentucky.

OIL WELLS.—One hundred and thirty oil wells are going down on the celebrated Pit Hole farm, in Pennsylvania.

PETROLEUM IN CALIFORNIA.—A tabular statement has been published of the various companies organized for producing coal oil in this State. The names of sixty five organized associations are given, whose lands are situated, mostly in Humboldt and Colusi counties. The aggregate capital stock amounts to about $45,000,000.

RATIFICATION.—Only seventeen States, thus far, have officially advised the ratification of the proposed amendment to the Constitution for the abolition of slavery.

THE PHILOSOPHY OF SLEEP.—Man spends fully one-third of his entire existence in sleep—a condition absolutely essential to the continuance of life. Considering the large proportion of time so occupied, and in view of the fact that that condition presents some of the most interesting and important phenomena connected with our existence, it is a matter of no little astonishment that it should be made so little a matter of study and investigation. Of late, however, physiologists are beginning to turn their attention somewhat more than formerly to a critical examination of its phenomena. But little progress has yet been made; yet the substance of what is known has recently been carefully digested and collected into an essay by Herbert Mayo, M. D., an English writer of considerable eminence, the substance of which essay we propose to place before our readers, from week to week, as among the most valuable class of "Useful Information," to which we can devote a portion of our miscellaneous columns. The first installment will be found in another column.

VALUABLE PUBLICATION.—Samuel Bowles & Co., of the Springfield (Mass.) *Republican*, have announced a publication, just ready to be issued from the press, which will contain a detailed account of Hon. Schuyler Colfax's journey across the plains to this State and Oregon, including extracts from his speeches, an Original Paper on the Mining Interests of the Pacific States, by William Ashburner, Esq., Mining Engineer of San Francisco, and Mineralogist to the California Geological Survey, and other matters of interest to a knowledge of the Western half of our Continent. This work will, doubtless, exert a very favorable influence for California at the East, and will be much sought after both there and here.

ATTEMPT TO DESTROY PROPERTY.—The Nevada *Transcript* says that an attempt was made on Saturday night last, to dest oy the celebrated Mugenta flume. The flume is the largest work of the kind in the State, and cost a very large sum of money. Two or three blasts were put into the heavy timbers that sustain it, and set off. The timbers were shattered and some damage done to the upper work. Some workmen, with whom the owners of the flume had a difficulty about wages, are suspected of the mischief. If we are not mistaken one or more similar attempts to destroy this property was made some two years since. No punishment is severe enough for a man who, to gratify a little spite against a single company, would destroy a property on the existence of which depended the opportunity of labor for thousands of men, against whom he could entertain no enmity.

IMPORTANT TOPOGRAPHICAL DISCOVERY.—The *Territorial Enterprise*, of Virginia City, is informed by Mr. Henry Donnell that he has discovered a new route by which a railroad can be constructed from the foot of Six-Mile Canyon, via Walker Lake and Red Mountain District, to Ruby Valley, without crossing a single chain of mountains in the entire distance. This, the *Enterprise* thinks, is something important for the contractors of the Pacific Railroad to know, and may ooe day be made available.

THE SONORA HERALD is the title of a new weekly paper recently established at Sonora, Tuolumne county, by Brunton & Coffin. The paper presents a fine typographical appearance and appears to be conducted with a degree of industry and ability, which ought to secure for it a liberal support. The last number containe an interesting article on the ancient gravel diggings of California, which we purpose to copy oext week, with comments.

EMIGRATION INTO HUMBOLDT COUNTY.—The Humboldt *Times* is informed by a gentleman just returned from the Northern mines, that there are one hundred emigraat wagons *en route* from Oregon for Humboldt county. The Quincy *Union* says about tweaty Cornish miners passed through that towa on Saturday, the 4th inst., on their way to the Crescent Mills.

RAILROADS.—An unusual degree of interest appears to be felt, at this time, in the various railroads in progress and in contemplation throughout the State. All those in progress are being pushed ahead with a most encouraging degree of energy, and give good evidence of "a good time coming."

METEOROLOGICAL DISTURBANCES.—The barometer on Thursday last indicated an unusual disturbance among the elements overhead. The variations were said to have been more sudden and the range wider than at any former time in years. It rose rapidly just before noon, but fell again towards evening.

A NEW and more careful survey of the route for a railroad from Stockton to Copperopolis makes the distance shorter by some ten miles than the line previously surveyed. The new course, however, necessitates a tunnel of 900 feet.

FROM four to five hundred working people at Worcester have resolved to abstain from the consumption of meat until the price becomes lower.

To Publishers.

An editor and practical printer, of good experience and recommendation, desires a situation and will accept a moderate salary on trial. Address this office.

PATENT RIGHT FOR SALE.—The exclusive right for the manufacture and sale of "Hutchinson's Wine and Cider Mill and Press, for the States of California and Oregon, is advertised for sale in another column. It is a valuable patent, and the offer affords a fine chance for business.

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1864, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5.

Terms of Subscription.

THE MINING AND SCIENTIFIC PRESS is published every Saturday morning (containing sixteen pages—size of *Harper's Weekly*) at the following rates:

One copy, one year, by mail, in advance	$5 00
One copy, six months, by mail, in advance	3 00
One copy, one year, by express	6 50
One copy, six months, by express	3 50
Five copies, one year, by mail, in advance	20 00
By city carriers, per month	50
Single copies	12½
Monthly Series (or parts), containing 4 Nos	50
Monthly Series, containing 5 Nos	62½

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising

DEWEY & CO., Proprietors,
Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

QUARTZ OPERATOR'S HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.
BOUND IN CLOTH—141 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs. W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

OUR NEW YORK AGENCY.

MR. GEO. M. NEWTON is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "STOCKHOLDER," **No. 72 William street.**

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, Mr. TURNER HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that of San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnasic Apparatus, which we used especially in the treatment of males, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The Institution is furnished with an abundance of pure, soft water, from numerous springs; and we now offer to Ministers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantage of the only *rational* system of medicine, the hospitalities of our Hygienic Home and Cure. Young men who have become debilitated or lost their health by excessive toil, exposure, or enervating habits, contracted through ignorance of Physical Law, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of drug medication in the cure of all disorders, whether acute or chronic; that it is followed by none of those debilitating diseases, such as Piles, Chronic Diarrhœa, Torpid Liver, Constipation, Intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Urethal Stricture, etc., which we well know result from the free use of mercury and other metallic drugs, together with stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary is now the most complete in its facilities for the cure of all cases commonly treated in all Eastern Water Cures or any like establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Wet and Cold Wet Sheet Packs, the Electro-Chemical Bath, Steam Baths, Improved Sitz Baths, Douch Baths, a Patent Spray Bath, and Magic Baths. The last named was invented by Dr. Smith with special reference to the cure of those diseases peculiar to males, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial, Lead, and Opium Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have yet used in eradicating all kinds of drugs and infectious poisons, and in the cure of all diseases induced by exposure to dampness and water, foul air, absence of light and electricity, retorting metals, the malaria of rivers and low marshy grounds. Where there was a fair constitution left, even when drugs had been applied for months at a time without a cure, we have, in the past seven years, treated successfully the following diseases: Chronic, Inflammatory and Mercurial Rheumatism; Paralysis; Lung, Bronchial and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Erysipelas, Scrofula, Piles, Inflammation of the Bowels, Diarrhœa, Chills and Fever, and all diseases and weaknesses peculiar to male and females. No physician in California is so favorably situated to furnish so many home comforts and hygienic conditions that are indispensable to the speedy recovery of nervous and chronic invalids. We have the only truly healthful boarding place in the State for men, women and children, with plenty of saddle and carriage horses for the use of patients and boarders.

To that class of Diseases and Weaknesses peculiar to females, and the medication that Hydropathic or Hygienic physicians employ in their cure, do we invite the special attention of patients and their friends. The ease and rapidity with which females suffering from general or special debility, recover in the bracing climate of the Bay, under Hygienic Medication, together with the native sal succus that has attended the treatment of females at Dr. Sioi's Institutions, (both in Sacramento and San Francisco) has induced us to make this class of diseases a specialty of our Institution. We have treated (mostly in the cure) over 300 females, several of whom had been "bedridden" for months and years, and all have been decidedly benefited, and with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former condition.

There is not one female invalid in twenty that has been suffering from nervous debility or diseases peculiar to her sex, that cannot be permanently cured by attending from four to six weeks at our Cure, and at the mere cost of $100. This statement we make in confidence, from an experience of the last seven years. From the many who have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1858.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a regular Charter from the Legislature of the State of New York, and is authorized to confer Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has labored successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo-Therapeutic College.

To all whom it may concern:

I have known Dr. Barlow J. Smith, both in our office as a student, and a practical Phrenologist in the country, and from what I know of him I can cheerfully recommend him as an honest, faithful delineator of character, and as such I can cheerfully recommend him to the public.

For the good of Science.
L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets. Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH,
20v11tf San Francisco, Box 473.

Just and True Economy
IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their Journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men immediately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by one-HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the Press or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of first honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

MINING BLANKS
For Sale
AT THE
OFFICE OF THE MINING AND SCIENTIFIC PRESS,
No. 505 Clay Street, corner of Sansome.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186, according to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]

Dated ....., 186

Assessment Notice.

..... Company

.....

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ....., 186, an Assessment of .....per share was levied upon the Capital Stock of said Company, payable on the ..th day of .....186, in United States gold and silver coin to the Secretary.

Any stock on which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186, to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.

Office.....

NOTICE.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186, the several amounts set opposite the names of the respective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophila Thisle	23	14	$140 00
Peter Pipo	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ....., 186, so many shares of each parcel of said stock as may be necessary, will be sold at the.....

....., on ....., the ..th day of ....., 186, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.

Office.....

☞ Our advertisers are furnished with blank Assessment Sale notices free of charge. Orders from the interior promptly filled, by mail or express, as may be desired.

Traveling Agent.

MR. ROBERT LATTIMORE is now on a canvassing tour for the PRESS through Butte, Colusi, Tehama, Shasta, and Siskiyou counties, and we recommend him to the favorable consideration of our friends.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

POSTPONEMENTS.—We would again call the attention of Secretaries to a certain point of the mining law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

Four persons recently died at Chester, Ill., from the effects of poison, administered by their attending physician, who received it in a sealed and unbroken package, precisely as it came from the wholesale druggist in St. Louis, and marked genuine English calomel. Upon examination it proved to be composed of calomel and corrosive sublimate, the latter resembling calomel to some extent, in appearance.

Another instance of the logical tendency of young minds recently came under our notice. A little philosopher, about thirty inches high, after finishing a glass of water, asked his mother if the glass was made of the same stuff as the pier glass, and being answered that it was, said, "Then a looking-glass is only a tumbler flattened out."

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

☞ Particular attention given to casting Rudder Braces and Ship Work in general.
☞ All Jobs promptly attended to. Prices moderate. ☜
No. 125 First street, opposite Minna, next door to Pacific Foundry. 12tf
Removed from Oregon street, between Front and Davis.

The laws of Nature are just, but terrible. There is no weak mercy in them. Cause and consequence are inseparable. The elements have no forbearance. The fire burns, the water drowns, the air consumes, the earth buries. And perhaps it would be well for our race if the punishment of crimes against the law of man were as inevitable as the punishment of crimes against the law of Nature—were man as unerring in his judgment as Nature.

Since the war began, 34,000 pensions have been issued to invalid soldiers, and 50,000 to widows, mothers, and minor children. The payments to pensioners the past year have amounted to $9,000,000, and it is stated, that when all pensions from the war shall have been granted, the annual expense will be about $13,000,000.

True Life.—The mere lapse of years is not life. To eat, drink, and sleep, to be exposed to darkness and to light; to pace round in the mill of habit, and turn the wheel of wealth; to make reason book keeper, and thought into an implement of trade—this is not life.

Ignorant men and women, who have become soured with the world, themselves, and their stomachs, are but crooked sticks which it is useless to attempt to make straight.

Boston has a population of 400,000 (with its suburbs) and a property valuation of nearly $500,000,000. It is probably the richest city, according to population, in the world.

The Union Bridge, over the Stanislaus, on on the road from Sonora to Copperopolis, cost $30,000. Upwards of 33,000 pounds of iron was used in its construction.

CALL STABLE.

N. GISHWILLER

Would respectfully inform the public that he has opened a large and well-arranged LIVERY STABLE,

On B street, Summit City, Cal,

(two doors below the Lake House), where good Saddle and Buggy Horses can be had at all times. Our charges will be reasonable, and we hope, by prompt attention, to merit a share of the public patronage. 10v11-3m

MITCHELL'S

COMBINED

FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

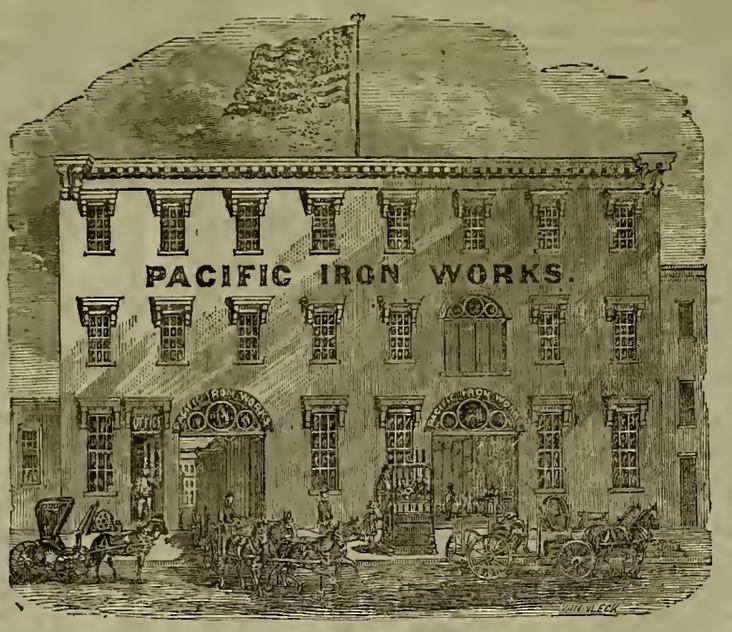
The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the Faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11-3m



THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

ALUM IN ALPINE.—The Monitor *Gazette* says that opposite the tunnel of the Monitor Consolidated Mining Company, high up in the hills of Alpine district, is a mine of pure alum; large masses of which, partly crystalized, but mainly in the form commonly known as burut alum, are found, and may be detected by the hand, having been formed by the oozing out of the mineral, and its accumulation by evaporation on the projecting rocks.

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of October, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at the salesrooms of John Middleton & Son, No. 404 Montgomery street, San Francisco, on Monday, the 4th of day December, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

S. P. DAVIS, Secretary.

Office, No. 103 California street, San Francisco. no18

Yuba Gold and Silver Mining Company, Brown's Valley, Yuba County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of November, 1865, an assessment of two dollars and fifty cents ($2 50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 210 Pine street, up stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 30th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

P. R. RINGSTROM, Secretary.

Office, 210 Pine street.

N. B.—The above assessment is for the purchase of Machinery, nov18

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 50 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. oc21

To Blacksmiths.

An excellent, strong lad, from the interior, 17 years of age, desires to learn the Blacksmith's trade. His parents wish him to engage with a reputable firm, and learn bl thoroughly. Address, or inquire at the office o the MINING AND SCIENTIFIC PRESS. 2v11tf

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Eagle Quartz Mining Company—Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of October, 1865, an assessment of seventy-five (75) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 605 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 25th day of November, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 11th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

nov4 CHARLES E. ABBOT, Secretary.

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Assessment No. 8.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 6th day of November, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on Saturday, the 9th day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 26th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 308 Montgomery street, San Francisco. nov11

Goodwin Gold and Silver Mining Company, Simpson Park Mining District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of November, 1865, an assessment of two dollars per share was levied upon the capital stock of said Company, payable on the 11th day of November, 1865, in United States gold and silver coin, to the Secretary, corner of Battery and Washington streets, San Francisco, Cal., or to S. G. BAKER, Austin, State of Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 30th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. V. JOICE, Secretary.

Office, corner Battery and Washington streets. nov11

No. 6, August 15, 1864—50 cents per share;

be, and the same are hereby annulled and declared void, and that all moneys paid to the Company on said assessments be placed to the credit of the stock on which it was paid, and apply as a credit upon the next assessment levied by the Company. By order of the Board of Trustees.

M. G. ELMORE, Secretary.

Office, No. 7 Stevenson Block, San Francisco. noll 4w

Zenith Gold and Silver Mining Company, Mountain Rauch District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 6th day of November, 1865, an assessment of three dollars and twenty-five cents ($3.25) per share was levied upon the assessable stock of said Company, payable immediately, in United States gold coin, to the Secretary, No. 7 Stevenson Block, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the 9th day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 23d day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. G. ELMORE, Secretary.

Office, No. 7 Stevenson Block, San Francisco. nov11

IN DEBT.—It is a common practice in this country for men and women to thrust their hands down into the *Future*, and draw from their present use upon their constitutional resources. They live, as far as physical vigor is concerned, constantly in debt. Their whole life is mortgaged for present enjoyment, and death forecloses and sells them out, and they pass away untimely to that "bourne from which no traveler returns."

A LITTLE girl washing linen in a brook in Baron Rothschild's park, at Schilleredorf, was seized and dangerously lacerated by a huge pike. The child was rescued by a gardener, who was obliged to cut off the fish's head.

FRENCHY.—An entirely subterranean theater is being constructed in Paris, at a cost of three millions of francs. It is expected that its coolness will be a great attraction in summer. Very much of what is customary in Parisian theaters had better be as far under the ground as is possible.

THE total annual products of coffee in the world is set down, in a recent circular, at an average of about six hundred and seventy-two million pounds, or about three hundred thousand tons. Half of this is produced in Brazil.

THIRTY-SEVENTH.—On and after the Fourth of July next there will be thirty-seven stars on the American flag—Colorado State will then be added.

THE brains of the gigantic deceased elephant, Cleopatra, were found to weigh fifteen pounds. They are preserved in a glass case.

Deserved Testimonial..

GRIZZLY FLAT, Oct. 18, 1865.

MESSRS. HUNGERFORD & HENDY—*Gentlemen:* We have run your Concentrator for several days past, in our 5 stamp Mill, and, as far as can be ascertained at present, it is a perfect success. When running at the rate of from two hundred and ten to two hundred and twenty-five revolutions per minute, we have lost neither quicksilver nor sulphurets. Formerly, when using copperplate riffles and blankets, we found that in spite of the utmost precaution, quicksilver would escape over them all. Wishing you all success, we remain Your obedient servants,

E. A. BIGLER.
S. F. DAVIS.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

OIL WELL BORING.
J. SEVENOAKS,
Contractor
For Well Boring and Erecting all kinds of Machinery connected therewith.

Having had extensive experience in boring for oil in Pennsylvania, Canada and elsewhere, I feel confident of being able to give entire satisfaction. Persons desirous of making contracts as above, or wishing information with regard to oil indications, etc., will please address me at the office of the "Mining and Scientific Press," San Francisco, or to my personal address, Box 1729 San Francisco. 2v11

LEHIGH COAL.
200 Tons Large Lump Lehigh Coal
Now on Hand.
I am also in constant receipt of
LEHIGH COAL,
And will be able to supply it always
At the Lowest Market Price.
JAMES R. DOYLE,
20v10-3m Pacific Coal Yard, 413 and 415 Pacific street.

A LITTLE BIRD RETURNS TO ITS CAGE.—The Stockton *Independent* relates a pleasing incident, as follows: "Sometime in May last Mr. Warder, pianist in this city, liberated four linnets—two gray and two green—from their cages in his room, and sent the little warblers out 'in the wide world' to take care of themselves. Imagine his surprise when one of the birds, more tame than the others, returned to its old home in Corinthian Block, on Tuesday morning last, and forthwith took possession of the cage it formerly occupied. At first Mr. Warner thought it was some estray from some dwelling in the city, but upon further examination it was found it was 'his own Bob.' This he knew from the fact that at one time in the attempt to cut a small string from the bird's foot, the top of one of its toes was accidentally clipped off. Recognizing it by its foot, Mr. W. called its name, and it immediately perched upon his extended hand as it had often done heretofore. The bird is now doubly endeared to its owner."

TAXES in England are profitable to the Government. From the smoking and drinking habits of the people, England derived more than one third of her whole revenue. is cited as proof that these taxes produce adulterations and drunkenness instead of reform.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Baugles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the MINING AND SCIENTIFIC PRESS. 19v11tf

Machinery.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Finchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Cracodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer.
24v9

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSITON ON the fire surface of a boiler takes THIRTY PER CENT of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to

JOHN MAILER,

Engineer of Pioneer Flour Mills, No. 515 Market street above First (opposite the Oriental Hotel), San Francisco
23v10

HUNTER'S

PREMIUM

CONCENTRATOR, AMALGAMATOR

AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste tree gold and amalgam is amalgamated on the copper plates; no loss of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, which the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,
15v12-3m Or to E. T. STEEN, Agent.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant st. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 9th 864.

HEPBURN & PETERSON.

4v10

ATTENTION, MINERS!

LINSCOTT'S PATENT

CHAMBER DRILL.

Great Improving in Blasting.

W. B. LAKE

Has taken the sole agency for the manufacture and sale upon the Pacific Coast of this valuable article, the object of which is to cut a chamber at the bottom of an ordinary drill-hole (as will be understood on reference to explanation of cut), giving more than double the effect in blasting.

D is the shaft of drill, forty-five inches in length. B represents the cutters extended after a blow has been given. The lower portion of B is a guide plate ⅜ inch thick, holding the cutters in place and allowing them to glide in and out freely, the surface of the rock preventing their falling out and securing their return. When closed the edges of the cutters protrude about 1.16 inch only. As the drill descends the force slide A strikes the bottom of the hole and a slight blow drives its wedged shaped head, C, upward, forcing the cutters upward and outward by double acting wedge power. Face of the cutters 1⅜ inches in length, diamond edged. There are but four pieces in all, two of which, the cutters, are detached.

Price of one drill with two sets of cutters, $35. Extra cutters, $5 per set.

Persons wishing further information about the working of this labor and money saving article, will please send for circulars containing full particulars, which will be furnished gratuitously upon addressing W. B. LAKE, General Purchasing and Advertising Agent, Room 28 Government House, San Francisco. 2v11

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combining SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed in work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

12v11 416 Market street, San Francisco.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood,

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

Stevens' Pressure Packing.

Patented March 7th, 1865,

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df ANDREW STEVENS.

STOW'S

PATENT CHAMBER DRILL.

The greatest Labor-saving Machine ever discovered for Quartz Mining. By using this Drill in Shafts, Tunnels, and all other rock blasting, three-fourths of the labor and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 2½ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, Sept. 1865, a Committee, after examining both the Lincoln's and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for Blasting rock, for the following reasons:

1st. For simplicity of construction;
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for $250, with one set of Cutters or Chisels that will chamber from 2½ to 4½ holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 6 Government Block, corner Sansome and Washington streets, and at No. 511 Market street.

Drills will be delivered to any part of this State free of expense to the purchaser. Any information desired, or orders for Drills, address

STOW & COLLINS,
San Francisco.

Oil Wells! Oil Wells!!

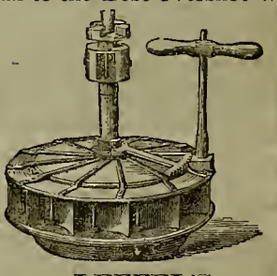
I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ⅓ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to mid-work with any common drill, at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

HENRY M. STOW,
14v11 San Francisco.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED



IN EXISTENCE.

LEFFEL'S

AMERICAN DOUBLE TURBINE

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30½. Thus we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,

At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

SALMON'S

PROPELLOR AMALGAMATOR

— AND —

Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

9v11 J. & W. C. SALMON.

OIL WELL BORERS.

A CONTRACT WILL BE LET TO A RESPONSIBLE party to sink an Oil Well, as deep as may be required, on land belonging to the "Eel River Oil Company," situated in Humboldt county, Cal. For particulars, inquire at the office of the Company, No. 436 Jackson st., up stairs.
12v11 1m E. H. WILSON, Secretary.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force. Introduces several important changes in our Patent System. The general duties of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, oath, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars: and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until election is given, or patent issued, if the patent is granted no further agency expenses ensues. If the application is rejected we a cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or printed on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On every application for an appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

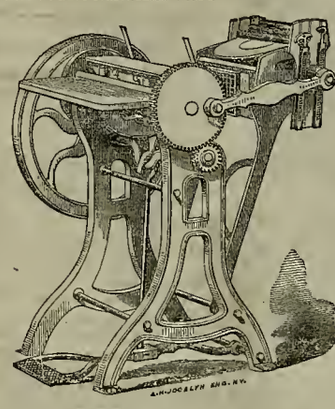
Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

STILL PROGRESSING!

THE OFFICE OF THE

Mining and Scientific Press

was removed, April 8, to the old printing stand lately known as Waters Bros. & Co's, southwest corner of Clay and Sansome streets (one block south of our former location). Where we have consolidated with a



JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for

CHEAP, RAPID AND FINE PRINTING.

We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,
BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.

City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

New Invention.

ROSENFIELD'S PATENT SAFETY WHIPPLETREE—the greatest thing out. The attention of all owners of Horses and Buggies is called to this valuable LIFE and Buggy saving invention, and which can be attached to all buggies and vehicles without any changes in the harness or buggy, and can be easily secured to any carriage in fifteen minutes. The great value of this Whippletree is, that a runaway horse can be instantly detached from a carriage without taking any portion of the vehicle. The public are invited to call and see it, and orders for the Whippletree left at No. 420 California street (northeast corner of California and Leidesdorff streets), Room No. 1, from 10 A. M. to 5 P. M., will be promptly attended to. Letters dropped through the Post Office, Box 1,944, will be promptly and fully answered. 15v11-1m

IMPORTANT MEETING OF MINERS IN COLORADO TERRITORY.

Pursuant to a notice published in the newspapers, a large number of the citizens of Colorado Territory, interested in mining, met in convention, at Central City, on the 8th of November, 1864, when Hon. Wm. R. Gorsline was called to the chair, and C. C. Post chosen Secretary.

His Excellency, Governor Evans, being present, was called on to address the meeting upon the subject of Congressional legislation in regard to the mining interest, which he did, at considerable length, after which he offered the following

PREAMBLE AND RESOLUTIONS.

WHEREAS, Various propositions have recently been presented to Congress, foreshadowing a change in the policy of the Government in regard to our mines, looking to the realization of immediate revenue rather than their rapid discovery and permanent and successful development, and

WHEREAS, There is great danger that such legislation may tend to cripple rather than to encourage our mining interests. Therefore,

Resolved, By this meeting of miners and other citizens of Colorado Territory,

1st. That we respectfully protest against the application of any system of *Tenantry* to the operation of our mines.

2d. That we respectfully ask Congress to pass a law, giving in fee simple, under proper regulations, at least one thousand lineal feet of each lode to such person or persons as shall hereafter discover and develop the same.

3d. That we ask that the miners' titles to the mines already discovered, as at present held by them, be confirmed by Congress.

4th. That we ask for the establishment of a mining Bureau in the Interior Department of the Government, and that Geological Surveys of our mineral regions may be provided for.

Which, after being fully discussed, were unanimously adopted.

The following resolutions were then offered by Gen. H. M. Teller:

Resolved, That his Excellency, Governor Evans, be requested to lay the proceedings of this meeting before Congress, in such manner as he may deem proper, and urge upon its attention the views expressed in the resolutions passed. Adopted.

Also, Resolved, That a copy of the proceedings of this meeting be forwarded to our delegate in Congress, the Hon. H. P. Bennett, and that the same be published in the various newspapers in the Territory; when,

On motion, the meeting adjourned.

In pursuance to one of the above resolutions, Gov. Evans forwarded the proceedings of the meeting to Washington, accompanied with an appropriate letter, and the subjoined "memorial," which we publish in full, as, in our belief, equally expressive of the views of a great majority of the citizens of California. The subject of the resolutions, and the accompanying memorial, will come up for discussion before the approaching Congress. We would ask the particular attention of the miners of California, Nevada, and other portions of the Pacific coast, to this matter, with especial reference to the action which may be had by the proposed convention or conventions which may be held the coming winter in the States and Territories, which have not yet made their voice heard directly at Washington. The following is the

MEMORIAL.

These resolutions may strike some who are not familiar with mining operations as presumptuous. But no one who has been a miner, or lived in a mining country—who knows by experience or actual observation, that the gold and silver of our mines costs its full value in actual labor and search to the masses of those who are engaged in the business—will fail to regard them as reasonable. I know that they have the hearty concurrence of the great body of the people of Colorado Territory, whether they are engaged in mining or other avocations, from general inquiry made, and the hearty unanimity with which they were adopted.

The farmer, the merchant, the banker, the manufacturer, and other classes, are each supposed best to understand the bearing of questions affecting their respective branches of business, and why should the miner be an exception?

Mining being a local business, and less generally understood than most others, requires more careful consideration before measures affecting its prosperity are adopted.

Hoping that these views of a respectable body of men engaged in the business, may receive a favorable consideration, they are submitted with the following suggestions:

NATIONAL IMPORTANCE OF MINING.

That part of the public domain lying between the eastern base of the Rocky Mountains and the Pacific Ocean, extending from British Columbia to Mexico, is nearly one thousand miles square, and while it is believed to be generally pervaded by rich mines, it is far the greater part a trackless waste, of mountains. Though containing treasures that might enrich the nation, it will to a great extent remain utterly useless until the prospector explores and seeks out its hidden treasures. And this can only be done to advantage by private enterprise. A wise political economy would seem to dictate the most liberal encouragement to citizens of the country to induce them to go in search of these hidden treasures. If they enrich her citizens, they enrich the nation whose wealth and power are not in national proprietorship, but in the actual wealth and strong arms of her people.

Mining for the precious metals in its relation to the national prosperity is a peculiar business, in that it converts all that is expended in carrying it on into gold and silver. The domestic production of bullion is a direct addition of its full amount to the national wealth. The national credit is measured by the amount of gold and silver, and of articles that are convertible into these that are in the country, and that can be produced in time to meet its necessities. Therefore, in proportion as bullion shall flow into the country, more and more rapidly the national credit will rise, whether it is derived from exportation or domestic production. Were it demonstrated that the balance of foreign trade would be largely increased in our favor for a series of years, the national credit would improve according to the amount of such balance. The same result would follow a like increase in the domestic production of bullion.

Therefore, to increase that production, is to increase the national credit. All the labor expended, the subsistence, iron and other manufactured articles consumed in the production of gold and silver in the country, are disposed of in a manner equivalent to their sale in a foreign market. To impose a royalty or any other special tax upon the business, is equivalent to an export duty upon the product of the labor, and the articles consumed in it. In other words, a tax upon the production of gold and silver at home, is, in effect, the same as a tax upon gold received from abroad, in payment for articles of export. Should such a tax diminish or retard the increase of the annual production, it would cost the government more than can be realized by the sale, the rent, or any other mode of taxing mines, for it would depreciate the national credit—and a small depreciation of national credit upon an annual expenditure of five hundred millions would exceed the entire annual domestic product of gold and silver.

That a tax upon the production of gold and silver, however imposed, will diminish the annual product, will appear from the following considerations: 1st, Producers of all other articles can save themselves from loss on account of the payment of special taxes, by increasing their prices. The miner cannot do so, for the product is the standard of all values. While it will cost him the same in gold to produce the bullion from this mine, with or without a tax, of course he must lose the full amount of tax imposed, which, in case of a large yield and small profit, would necessitate a loss, and a suspension of the business. If the relative value of the gold is increased by the amount of the tax, the object of collecting it, which is to keep the national credit good, and thus keep down the price of gold, is defeated effectually.

If the annual product of gold could be increased proportionally by a payment of a premium on the production of the precious metals, and the continued freedom of the mines, it would seem to be a wiser policy, for there can be no more important product to the national interest; certainly fish are not, upon which a bounty is paid.

If fishing educates seamen, prospecting inures to the dangers and hardships of camp life. If fish are the result of uncertain research, hunting for undiscovered mines, from which the greatest increase of production hoped for must come, is equally uncertain. The chance of success in finding rich mines is the stimulus to search for them—and if by making the usage that has prevailed since the discovery of gold and silver in the mountains, the usage that gives the miner the mine for its discovery is a law of Congress, it is really adding no more encouragement to mining than its national importance, and the vast extent of unexplored country lying idle seems to demand. And if, as is asserted to be true, the mines really cost in the aggregate expense of their discovery and development all that they are worth, justice, as well as proper encouragement to mining, would seem to demand that those who succeeded in finding and opening valuable mines should be entitled to their proprietorship. I am satisfied that any legislation that does not recognize this policy and right will seriously impede the progress of mining operations.

The vast extent of unoccupied agricultural lands long held by the general government, added but little to the available wealth of the nation, except as they were cultivated by private enterprise. To the hardy and enterprising pioneer who penetrated the wilderness under privation, and in the face of danger, does the government owe the development of the vast region of almost boundless wealth and prosperity lying west of the Alleghany mountains. This region grew more and more rapidly as the land policy became more liberal, under the light of experience, which has finally developed the true political economy in the Homestead Law. In like manner the vast extent of mineral lands belonging to the government are valueless, except as the mines are discovered and developed by private enterprise. To encourage this discovery and development, by freely offering a title to such citizens as will find and develope mines, without the tedious course of discussion which preceded the Homestead policy, would speedily add to the national wealth and power another great right arm of strength. If a guarantee of title to a large extent of lode from the general government is offered, it will increase the inducements to prospectors to search for them. A premium on production would tend to more rapid development. But whether the premium is offered or not, the guarantee asked for in the second resolution would largely promote activity in mining.

SALE OF THE MINERAL LANDS.

Aside from the question of expediency, is the sale of the mineral lands practicable? The gulch or placer mines are divided into small tracts by the miners' laws, and are soon exhausted, some in a few months, others in a few years. The delay of surveying them after their discovery would find many worked out. To require government surveys before they should be worked, if it were practicable, would check prospecting and discoveries, and it would largely diminish the product. To sell or in any way interfere with the miners' regulations in regard to this class of mines, it is believed would be impracticable and inexpedient.

The Lode mines, to which the resolutions have particular reference, are more permanent, and more difficult and expensive to develop and operate—from fifty to two hundred and fifty thousand dollars being required usually for sinking shafts, opening the mines, and erecting the necessary machinery. These mines which are to be the permanent sources of our domestic product of gold and silver, have thus far been developed but slowly—the principal part of the gold product of the country having been thus far derived from the placer or gulch mines. The difficulties in the way of the more rapid discovery and development of lode mines are expense and hazard attending the business. The prospector first finds a blossom or surface indication of a lode, which may be fallacious. He then digs until he finds a crevice or vein. He then sinks a shaft to prove its extent, and tests the richness of the ore, and in a large proportion of cases to find the quantity too limited, or the quality too poor. When he finds it valuable, he must procure the large capital necessary to work it, before he can make his discovery available. The rich mines when found and proved, are the prizes for which all the successful and unsuccessful efforts of the miners are made. Before their discovery they could scarcely be said to have any value, at least their value was like that of the fish on your coasts and in your rivers. The privilege of finding them was at the risk of loss of time and means. When discovered and opened under the circumstances to whom do they in equity belong? What interest in them can the government sell, and how shall its amount be determined?

Mines not already found of course cannot be sold. The privilege of finding mines would scarcely be current in the market. Those that are found to be worthless would not sell, and therefore sales must be confined to those that have under these circumstances been proved to be valuable. To those in which large amounts have been invested under the usage of a free privilege to miners, and the universal conviction among miners that the government would not interfere with the miners' titles, which conviction has gained strength and increased confidence ever since the abandonment of the proposition to sell the mineral lands, that was before Congress soon after the acquisition of California.

The sale of the mineral lands would require their survey into subdivisions which must correspond with the lodes. If surveyed into tracts that would give the present occupants and owners tracts of land that included their mines, and justice would require this, it would be attended by insuperable embarrassments. Many of the lodes run so as to cross each other. In some instances valuable lodes are near to each other, sometimes they approximate for a distance and then coalesce—many

of the veins are crooked, and meandering in their course, both on the surface and as they descend. Most of them descend at an angle some with greater and others with less dip—so that if surveyed on the surface to include each lode and give the preseat proprietor his mine, he would, by following it down, find it to cross the line of his boundary and lose it after all his expenditures. In many places the mines are found where the mountains are so steep and their course so irregular that it would require the most expensive and difficult survey to define a tract to include one mine without another even on the surface.

From those facts it will be seen how utterly impracticable it would be to lay the mineral lands off into tracts for the purpose of sale. Nor would the attempt to issue patents to tracts even if surveyed so as to include each miner's interest separately, be attended with less difficulty. As at present held under miners' laws there have been numerous transfers or titles, cases of contest have been adjudicated by the U. S. and miners, courts under miners laws thus in almost all of our mining districts a well established and recognized system of common law has grown up, under which the equities have been defined and are well understood. Should the government now issue patents to lands covering these mines, justice to the owners would require an adjudication of title before such patent should issue. And as the laws of the different districts vary in their provisions, a general rule for such adjudication could not be properly adopted. It may be observed that the same difficulties would attend the confirmation of titles by leasing. The expenses of such a preparation for sale, and the difficulties attending it would be enormous. Then to sell the mineral lands in legal subdivision, would be liable to give a single proprietor a large number of valuable mines, and thus lock them up from those who would otherwise discover and develop them. Nor is this all; the unsettlement of titles by any modification of the present system would create at least temporary embarrassment, and seriously retard the progress of mining operations.

LEASING THE MINES.

Any system of tenantry by large classes of citizens is objectionable on general principles, in addition to the difficulties attending its inauguration.

The experience of the government of the old world in converting themselves into landlords, and miners into tenants, by which it has required hundreds of years to develop and discover so as to make productive many of their richest mines, ought to prove that the system is not adapted to American enterprise or American progress. And the attempt and signal failure of our own government to do the same under the law of 1807, fully proves its want of adaptation to the disposition, habits, modes of business and spirit of enterprise of the people. In the language of Senator Benton, used when speaking on the subject of leasing mines, "the spirit of tenantry is every- "where the same, it is a spirit adverse to im- "provements, always bearing towards the "injury of the property in possession, and "always holding back from the payment of "rents."

GUARANTY OF NEW DISCOVERIES.

It is an important object to the government to encourage the rapid discovery and developments of new mines. The inducement proposed in the resolution is the cheapest and most equitable that can be offered. The extent of lode above the usual amount of one or two hundred feet would be the stimulus to enterprise, and but equitable to the discoverer, would thus secure the benefit of his labor and search, instead of having them divided and shared by those who had borne no part of the expense. And it would promote the more rapid, permanent, and successful development of mines by justifying a large outlay for working them. It would in other words put new life into the business of lode mining. It would hasten the time when the almost limitless mountain wilds of our country would be thoroughly explored, and their mineral treasures brought to light. When rich and populous mining settlements, with their industry, their trade, their cities, and permanent social institutions would spring up in places now desolate. It would soon fill up the chasm between the Atlantic and Pacific States, and by contiguity of settlement, increase their identity of interest. It would hasten the construction, and secure the maintenance of the Pacific Railroad, and by means of branches throw upon it a commerce and travel that would insure its success beyond the anticipation of its most sanguine friends. Such are some of the influences of the liberal policy asked for, on our national interests and general prosperity.

RATIFICATION OF THE MINERS' TITLES.

That this is the only feasible mode of giving the government title, without great embarrassment, difficulty and expense, appears from what has already been said. That it is the only mode of doing exact and equal justice to the owners of claims, who have acquired and now hold them under well defined and adjudicated laws and regulations, must be equally plain. In the legislation of all the mining States and Territories in regard to mining rights and equities, it has been found to be the wisest and best policy to recognize the miners' laws. It is the simplest, if not the only practicable and just mode by which any legislation can be applied in the case. Nor would such a ratification interfere with the question of taxation should it be deemed expedient to impose a special tax upon mining for the precious metals, for it is believed that more economical and less objectionable modes of collecting taxes, than by sale or lease, are easily devised. It would remove the stigma of being called trespassers, which has by some been applied to miners, and which as loyal citizens, in the pursuit of a laudable and highly important branch of industry, they ought not to be considered. They have been encouraged by the Government through a series of years in their occupation of the mineral lands. This has been done by establishing mints for the receipt of the product of their labor, by the establishment of post roads, mail lines and post offices, for their accommodation, by the establishment of posts and garrisons of troops in their midst, and on the lines of their emigration and travel for their protection, and by the inauguration of temporary governments for them, and for the adjudication of their rights in the United States courts.

With the adoption of the policy indicated in the resolutions, and the establishment of a mining bureau, for collecting and diffusing information upon the extent, location and character of our mines, and the best mode of mining and saving precious metals, a new era of prosperity would open upon the mining interests, and the permanent and rapidly increasing annual domestic product of gold and silver would become the strong right arm of support to the national finances, and the government credit.

THE CHOLERA ATMOSPHERE.—Two balloons were sent up, one of them over Alexandria, the other over a village in the isthmus where cholera had not made its appearance. From each of the balloons was suspended a piece of fresh beef cut from the same ox. After the balloons had remained up for some hours they were both pulled down, and the beef suspended over Alexandria was completely tainted, while that which had been suspended over the village was as sweet and good as ever.—*Galignani.*

A similar experiment was tried in Chicago a few years since, while the cholera was raging there, and with similar results.

THE POSTAGE MONEY ORDER SYSTEM will soon be in operation in this State. Only large towns, or "distributing offices," are to be accommodated, however. It is a benefit we have long needed from the government, and will prove a particular favor to the great mediocrity of our population. Following are the regulations:

The charges for drafts or orders, payable at any *distributing* post office in the United States, are as follows: Sums under $10, ten cents; over $10 and under $20, fifteen cents; over $20 and not exceeding $30, twenty cents. No orders for over $30 will be issued. The orders are payable in U. S. Legal Tenders, or the bills of the National Banks, and are purchasable at par for like funds; in other words, you pay $10, $20 or $30, and the registry fee, in greenbacks, and get an order for a corresponding amount in the same funds.

THE CALIFORNIA COASTING TRADE.—From the annual report of the Harbor Master of this city, it appears that there are five hundred and twenty-seven vessels engaged in the coast and bay trade, classified as follows: thirty-one steamers, seven ships, fifty barks, twenty-six brigs, and two-hundred and ninety-one schooners, and one hundred and twenty-one sloops.

INSANITY FROM SMOKING.—The following incident is indicative of the deleterious effect upon the brain of the excessive use of tobacco in smoking: A man named Samuel Taylor, thirty-six years of age, residing in Finsbury, hanged himself, and at the inquest his father, who gave evidence, attributed the act to his son's partiality for smoking, which he thought had affected his brain.

IT has been reported to the General Land Office, that extensive gold discoveries have been made on the northern shores of the west end of Lake Superior, in the Northeastern Land District of Minnesota, which are attracting general attention.

SLATE, copper, plumbago and silk, according to reports, are now to be included in the productions of New England. The silk is said to be extremely plentiful, and produced by a common caterpillar, which has been looked on as a pest. It feeds on the common scrub oak.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

ANSWER TO "ELECTRICAL QUERIES."

MESSRS. EDITORS:—I regret that the author of "Electrical Queries," which appeared in your issue of the 28th ultimo, did not read my communication more attentively. Will he please read it again.

He understood me to say that "electricity is not an entity, but a condition." I most distinctly said that electricity is a property or quality of matter, and that it *exists* in two conditions—namely, as free electricity, or as latent (or fixed) electricity. I also said, and meant, too, that the density of matter is the measure of its capacity for electricity. When we speak of the capacity of bodies for heat, reference is supposed to be had to the amount of latent heat such bodies contain—the gases containing the most, and the more dense of the metals containing the least. In expressing my ideas of the laws which govern electrical action, I endeavored to select such words as would render it unnecessary for any person to go outside of my language for my meaning.

I will endeavor to explain how an electrical current is lost when but one wire is used, and why it is necessary that the circuit should be completed with insulated wire in ocean telegraphy. While so doing, I wish the fact to be borne in mind that the earth is a vast reservoir of free electricity, and also that free electricity tends to equal diffusion over bodies with which it may be in contact. I will here describe an experiment which goes a long way towards establishing these propositions. Take a leyden jar, insulate it upon a stand, and bring it within a short distance of the ball of a prime conductor, and it will receive only a few sparks. Now, if we place a conductor which is connected with the ground, near the outside coating of the jar, it will be found that for every spark that passes between the prime conductor and jar, one passes between the outside coating and the ground; and spark follows spark in rapid succession, until the jar is fully charged. This experiment indicates to what an extent the outside coating was charged with free electricity. Before the jar was insulated upon the stand it must be admitted that an electrical equilibrium must have existed between its outside coating and the surrounding bodies with which it was in electrical communication; it also follows, as a matter of course, that an electrical equilibrium existed between the outside coating of the jar and the whole earth. (I would here suggest that an apparatus might be devised, to measure the exact amount of free electricity diffused over any given space.)

As all bodies in electrical communication with the earth are so largely charged with free electricity in ordinary telegraphy, the current is effected by displacement. And as the current is effected by displacement, the time between the entrance of a spark at one end, and the departure of a spark from the other, would probably not be appreciable in a cable of any desired length. Suppose the circuit to be completed across the Atlantic, with insulated wire, a lengthy message might be transmitted before its ordinary charge of free electricity would all be displaced or renewed.

The whole earth is bathed with an ocean of free electricity, and it is so good a conductor that its electrical tension cannot differ much in different parts; yet, it differs sufficiently to produce the terrestial currents. There are probably not five days in the [Our correspondent, probably, unintentionally omitted the word "year," in his manuscript at this point.—ED. PRESS.] when an exact electrical equilibrium exists between the two shores of the Atlantic ocean. Now, suppose the western shore to be more highly charged than the eastern, and in attempting to telegraph, we pass a current of electricity along a single wire, on its arrival at the eastern shore it would become diffused and go to assist in restoring the electrical equilibrium, and thus its effect would be lost. The difficulty does not end here; for if we have but a single cable stretched across the Atlantic, and each end of it connected with the ground, it is evident that a certain amount of terrestial electricity, varying with the difference in the electrical tension between the two shores, would pass along the cable, because it is a better conductor than the earth.

With the first Atlantic cable, during fair weather, there were intervals in which they were able to overcome these terestrial currents, and hold telegraphic communication. But when stormy weather set in, these currents were so strong that the operator lost all control over the cable. It was reported at the time that the telegraphic apparatus kept up a continual clatter. It was also said that the operator tried to regain control of the cable, by increasing the power of the batteries; after which it was reported that all action had suddenly ceased. An attempt, at a subsequent period, to recover the cable, revealed the fact that it was destroyed! Its destruction was, probably, due to its being overcharged, and consequently heated.

If we confine the returning current within the limits of an insulated wire, and thus seek to be independent of all outside electrical disturbance, the difficulties and uncertainties I have endeavored to point out will be avoided. A perfectly constructed cable might be made to encircle our globe, and its volume would not probably amount to an obstruction of the electrical current.

I wish to correct two typographical errors which occurred in my last communication, entitled "Electricity—Its Relation to Matter," as they have a tendency to obscure my meaning. In the 7th postulate, for "the electricity," read "free electricity." In the first sentence in the first paragraph, following the 8th postulate, for "perfectly electrical," read "permanently electrical."

F. A. H.

[Written for the Mining and Scientific Press.]

LETTER FROM VIRGINIA CITY.

MESSRS. EDITORS:—The charmingly pleasant weather in this precocious mountain city, whose great altitude drives it, theoretically, several degrees of latitude northward, towards the Arctic regions—the delightful and balmy air of the evenings, now brilliantly illumined by a full moon of almost polar splendor, whose softened light is delicately tinged by a smoky haze that bathes the "Sugar Loaf," as it stands guard in the canon, below the extensive quartz milling establishment of the famous Gould & Curry Mining company, and hovers over the desert beyond, and along the willowy banks of the Carson, far away eastward, where the great bend of the river, near Fort Churchill, obstructs the valley vision, made a most favorable impression on my mind, which involuntarily traveled Eastward to the Atlantic slope, to the home of my childhood; and it only lacked the rustle of the falling leaves of the expiring year to vividly recall to mind the "Indian Summer" of childhood, jocund with "huskings," "apple parings," and other autumnal amusements, peculiar to the happy "days of auld lang syne." The city of Virginia, situated as it is about half way up the eastern slope of Mount Davidson, which has a direction nearly north and south, and whose summit is the highest peak in a short range of mountains extending from Eagle Valley, near Carson on the south, to the Truckee Meadows on the north, and which separates this wealthy mineral belt from Washoe and Steamboat valleys, and the extensive and richly-timbered ranges of the Sierra on the west, has in its western and most lofty streets an extensive and charming panorama always spread out before its ever-delighted denizens. The mountain ranges, as you face the home of the morning sun, stretch north, east, and south, with their snow-capped peaks dwelling in the regions of perennial congelation, and all the intervening space filled up with rugged hills and mountains, of various sizes and forms innumerable, with bluffs and gorges, and peaks, and minaret-like spires, and knolls, and plains, and all fantastically grouped, and presenting somewhat the appearance of an extensive fleet of icebergs anchored in a polar sea, giving the prospect a wildness sublimely grand, which must be seen to be appreciated.

THE MINES.

The streets of Virginia present very much more of business, bustle and commercial activity than I had reason to expect, from the confident prophecies of the bears, and the recent extraordinary tumble experienced by the mining stocks of the Comstock range. My stay here has been too brief (I shall leave for Austin in the morning stage) to allow me to speak of the mines, of their value and extent, as confidently as I might, had I given them a thorough personal exploration. I went through the Crown Point and examined it more

thoroughly than any other herenbouts, and judging from what I saw, and from information derived from sources which I deem reliable, I confess myself unable to discover any just reason for the present depreciation of the Washoe mining stocks.

On the part of the directors of most of the mines on the Comstock, there is at present less inclination to work out those bodies of ore in sight than to prospect for undiscovered deposits, by following down the shafts to much deeper lower levels than has been heretofore attained, and by driving galleries in various directions, to expose the hidden wealth below. Hereafter mine working will be controlled more by sight, and less by blind faith, than heretofore. Notwithstanding the present temporary draw-backs to the raising of large quantities of ore for the mills, I understand that their product for the month just passed equalled that of either of the three preceding months. In a short time the Gould & Curry will reach a level of one thousand feet below the surface, and the Chollar mine will soon attain nearly an equal depth. The Hale & Norcross recently, at a depth of seven hundred feet, struck a body of good ore. Should the G. & C. and the Chollar be equally successful, a new confidence will be awakened in the wealth and stability of this entire range.

The present depression will not be without its uses. Hereafter, I think, it is safe to predict that a majority of the mines in this county will be conducted more with a view to the general interests of the stockholders than, as heretofore, for speculative purposes on the part of their managers. It will conspire to bring about a system of economy heretofore unpracticed, if not unknown. The price of milling ores has already been essentially reduced, and to-day ores are mined and reduced, at a small profit to the mine, that less than a score of months since were considered worthless. There are along the entire range of this extraordinary lode, where it has been reached by the pick and shovel of the explorer, huge masses of ores of a low grade, that will add essentially to the value of these mines when some more efficient and economical system of machinery and milling will come into use than are now employed.

A NEW AND IMPROVED QUARTZ MILL.

Speaking of an improved and cheapened system of working ores, calls to mind a model of a new quartz mill, for extracting the precious metals from the ores of gold and silver, recently invented by Col. Jno. A. Collins of this city, and which promises, when brought into practical operation, in my humble judgment, to work a revolution in quartz milling. The mill is so simple in its construction, so comprehensive and effective in its working arrangements, so exempt from that system of gearing, shafting, belting, and the vast amount of intervening machinery that consumes power, costs money, requires attention, and is constantly liable to derangement, indispensably necessary to our present milling machinery, that I am confident you will cheerfully grant me the necessary space to furnish your readers with a very brief description of this new candidate for public favor. Before doing so, however, allow me to say that the machine embraces no new or untried mechanical principles, either in its crushing or amalgamating department, but it simply embraces an ingenious grouping together, within a small space, of all the most effective mechanical arrangements known to the fraternity of quartz reducers.

This invention embraces the Chile mill process of crushing, much improved, however, and both the Barrel and Pan process of amalgamation. From three to six iron-shod wheels, from three to six feet in diameter, according to the size of the mill, are made to follow each other around in a circular iron trough, crushing the ore as in a Chile mill. The crusher of each of these wheels consists of a barrel from three to six feet in length, similar to the Frieberg barrels, so that when filled with pulp charged with the proper chemicals, the amalgamation is going on while the wheels are crushing ores. These wheels are driven by applying the power directly upon the periphery instead of the axle, and herein consists one of the great merits of the invention. A circular iron plate, resting on the tops of the wheels, and weighted down sufficiently, is made to revolve by means of an upright, center shaft, to which the driving-power is applied. The wheels are kept in position, and guided by a fixed attachment or revolving axle, not connected with the driving-power. The crushing capacity of the wheels is regulated principally by the weight of the wheels and barrels combined, and the ballast with which the driving-plate is weighted—the pulp in the barrel thus assisting to crush the ore to supply it, without occupying any additional space and requiring but a small additional amount of power.

The Pan process consists in placing, in iron-lined barrels, of similar dimensions to those described above for the Fricberg process, cast-iron rollers, having a length equal to that of the inner dimensions of the barrel, but of unequal diameter, which create, in addition to a crushing, a reverse and grinding motion, ; and, enveloped in the pulp, revolve and slide on the inner surface of the barrel, while it rotates and grinds the ores for amalgamation. It is estimated that three of these barrel-wheels rotating in an iron trough or road bed, ten or twelve feet in diameter, will crush and amalgamate, in a day of twenty-four hours, fully twenty tons of quartz ore; for each wheel passing once around the circuit will, with sufficient weight, completely pulverize one charge of ore; but the capacity of the mill may be doubled by adding three more barrel-wheels, to work on the same track and between the other barrel-wheels, without any additional cost, but for the expense of the barrel-wheels. The capacity of this double mill may again be doubled, without increasing the space occupied, by putting another set of six wheels above them, upon the circular driving-plate, which becomes the bed of the upper set of crushing and amalgamating machinery or wheels, and, at the same time, the driving power of both, and the weight of the upper wheels, seems as ballast for the lower. Another circular plate, with weights upon it, rests upon the tops of the other wheels, but is disconnected from the driving-shaft.

Another great advantage in this machine is, that it will crush the ores dry, and as well, and as rapidly, as in water, without damage to the machinery, as is the case with our present crushing machinery.

I have not space in a letter to enter into a detailed description of all the features of this invention. The model to be appreciated in all its advantages should be seen; but I have, I think, said enough to give you a general idea of its operation and the principles involved.

The advantages summed up, appear to me, among many others, to embrace the following, to wit:

1st. The great economy of power, secured by applying the power to the periphery of the wheel instead of the axle, and also by effecting the crushing and amalgamation by one and the same motion.

2d. The small space occupied by buildings and machinery, and the consequent diminished cost of construction for milling purposes. There is no complicated, cumbersome, and expensive gearing, shafting, or belting, required in the first instance, or to be kept in repair afterwards. Being very simple, and occupying so little space, it requires a much less number of laborers to work it, much less power to drive it, and much less expense for repairs or for replacing of machinery. Compared to ordinary stamp-mills and amalgamating-pans of the same capacity, the first cost is insignificant, and that of running and repairing equally so.

3d. The requisites for successful amalgamation are secured—the ores are reduced to the requisite fineness of the crushers or wheels, and by the rollers within them. The mercury and the pulp are brought into close contact, and kept so for the necessary length of time to secure the amalgamation of the precious metals. The friction necessary to aid electrical currents, to aid in vitalizing quicksilver and decomposing the sulphurets, and the formation of amalgam, is admirably secured by the action of the iron rollers within the barrels.

4th. The invention may be used on a large or on a small scale, to suit the convenience or wants of different parties. It may be driven by horse-power for small rich ledges, like those of Reese River, and other localities, and may be made portable, like a threshing machine, for prospecting; or it may be by steam or water-power, on as grand a scale as the most ambitious could desire.

With my best wishes for the success of your valuable journal,

I am, etc.,

J. E. Clayton.

Virginia City, Nov. 2, 1865.

Hard Hydraulic Cement.—The following receipt is given for a cement which it is said has been used with great success in covering terraces, lining basins, soldering stones, etc., and everywhere resists the filtration of water. It is so hard that it scratches iron. It is formed of ninety three parts of well burned brick, and seven parts litharge, made plastic with linseed oil. The brick and litharge are pulverized; the latter must always be reduced to a very fine powder; they are mixed together, and enough of linseed oil added. It is then applied in the manner of plaster, the body that is to be covered being always previously wet with a sponge. This precaution is indispensable, otherwise the oil would filter through the body and prevent the mastic from acquiring the desired hardness. When it is extended over a large surface, it sometimes happens to have flaws in it, which must be filled up with a fresh quantity of the cement. In three or four days it becomes firm. If its advantages have not been overrated it must be a very excellent cement for rendering the joints of aquariums water tight. Try it and see.

Useful Information.

The Philosophy of Sleep.

NUMBER TWO.

THE PHENOMENA OF DREAMING.

In dreams, that which most strikes us are their monstrous and capricious combinations, and our want of surprise at their improbability. Thought suggests thought perfectly at random; the laws of mental crystallization seem suspended or confounded; any side of any element of thought appears capable of attracting the unlikeliest relation of another. Yet we seem to see nothing extraordinary in the fantastic creations.

A check is absent in dreaming, which our waking reason uses. When awake, we recollect our just relation to every event and person presented to our senses or to our thoughts; something like our true position is constantly before us. In dreams this is quite forgotten—wife, children, home, are not ours; while the friends, whom we have lost, meet and converse with us, as if they were our daily companions. Our fancy experiences no check from reality; the link which unites its operations with the past and the present and the future is temporarily unloosed.

IN SLEEP THE MIND IS PUT OUT OF GEAR.

The mind may be said in sleep to be put *out of gear*. When we dream, the engine continues to work, but the whirl of thought has no bearing upon our practical being. It does not use our memory of the past, or touch or influence our present purposes. Our every-day existence is veiled from the play of our associations; our anxious and responsible nature, with all its thoughts and cares, is wrapt in oblivion. Imagination, so dimly lighted is the cell where Reason sleeps, looks upon our tired hopes, and fears, and wants, and does not recognize them.

Sir John Franklin remarks, when his party was in the extremity of physical exhaustion and physical suffering—when they were compelled to sustain life by eating their old shoes and gun-covers—"Although the sensation of hunger was no longer felt by any of us;—yet we were scarcely able to converse on any other subject than the pleasure of eating." *But their dreams at this period, while they were starving, were of plentiful repasts.*

It may be difficult to go deeper than the observation of the fact of sleep and its final cause. Its purpose is Rest. This Nature effects in sleep, by detaching our mental powers from our recollections; the former may move rapidly, or be quiescent,—it matters not:—the resistance is removed,—the engine whirls on without strain or effort,—the machinery of our being is unloosed from it. It would be pursuing the analogy too far, to conjecture that this fact explains the rapidity of thought in dreams.

OTHER PHENOMENA OF DREAMING.

Still, however, we may try another cast on this topic. We *will* in our dreams; and what we will seems to be accomplished; we seem to move, but without real bodily motion; we seem to speak, but without really uttering a sound,—the mental powers do not draw after them corporeal actions. [This, the experience of most people assures them is not always the case.—Ed. Press]. We equally seem to see others move, and to hear others speak. We are, then, it is evident, in both cases, attending only to the play of our imagination. We really are neither perceiving nor willing. We are absorbed by the flow of our fancy alone. But why has it this unaccustomed force of reality, and why do we not detect the absurdity of its combinations? One reason certainly is, that the external world is now shut out. Thought has retired within itself. The principal avenues of sensation are closed; the bodily sensibility has become duller; the outward impressions, which in our day-dreams are still present to check the wandering mind, are no longer there to moderate its flights.

Perhaps all the phenomena of sleep and of ordinary dreams may be explained by the supposition that the faculty of attention is suspended in sleep, or that sleep consists in a suspension of the act of attention. It is, however, not easy to define rigorously and satisfactory what attention means. In the waking state we are, as it were, asleep to all other impressions, when the attention is concentrated on one.

CONDITION OF THE BRAIN DURING SLEEP.

No physiological inquiry is more pregnant than this. A case is related by Blumenbach, of a person who had been trepanned, and whose brain was observed *to sink when he was asleep*, and swell out when he was awake, *—a proof that the cerebral circulation is more languid when we sleep than when we are awake.* The brain is not moved and excited by the same eddy and tumult of the blood during sleep as during the hours of waking. Accordingly, all the circumstances which hurry the circulation, such as mental contention, thought, joy, anxiety, bodily exertion, excite the heart's action, and are antidotes to sleep.

It is not equally easy to prove, but on reflection it appears no less certain, that *the nervous power of the brain is lowered in sleep;* that the depression of the cerebral circulation is accompanied by depression of cerebral energy. For how else are we to account for the slowness or suspension of digestion during sleep, the feebleness of the heart's action, the susceptibility of cold. "The steam has been turned off," and the body is relaxed; its functions (a fact best perhaps shown in hybernating animals) are half at a stand-still; that which imparts force and activity to every function is no longer generated in adequate power and quantity; the brain, the main source of nervous energy, is in repose.

CONNECTION BETWEEN SLEEP AND BRAIN ATTACKS.

The bearing of these conclusions, if just, upon cerebral disease, is of great importance. *Brain attacks generally come on during the night, and during sleep.* That is to say, *they mostly supervene at the time when the power of the brain is lowered.* They are then, in some degree, connected with depression of the cerebral forces. They are favored by weakness and exhaustion of the brain.

The attacks to which I refer are epilepsy, apoplexy, and palsy; the common impression respecting which is, that they proceed from determination of blood to the brain, or from some kind of force or pressure operating actively to disturb the functions of the organ. I believe, on the contrary, that in the *majority* of cases, especially in advanced life, these seizures, taken as a class, result from cerebral failure, from weakness, depression of power, temporary or permanent, of some part or the whole of the brain.

It does not contravene the preceding conclusion, that these complaints are liable to be primarily induced by *action in the head*;—that where they do not result from alteration of structure, they often may be traced to habits of full living and strong excitement, which have frequently thrown the blood in hurried and violent circulation through the brain:—and that besides, in many instances, a loaded and labored circulation goes with, and gives increased danger to such attacks.

The mildest form of epilepsy is best described by the term "desertion of mind." It consists in sudden failure of consciousness frequently unattended with giddiness, often so transient, that the patient does not fall, but recovers in time to save himself. When such slight attacks occur in the night, the patient before sleeping tranquilly, starts up abruptly, awakened by the consciousness that he is rallying from such a sudden oblivion. These attacks are often attended with a feeble or failing pulse, sudden perspiration, every sign of physical and nervous weakness; they are cerebral debility, and at the moment, stimulants should be used to rouse the languid brain and heart.

[To be Continued.]

Varnishing Furniture.

The appearance of furniture may be greatly improved by a coat of good varnish, which a skillful housekeeper may lay on quite as well as some manufacturers of furniture. The proper tools and materials are quite as essential as skill in order to varnish neatly. A clean, light and warm room is indispensable, unless it can be done in the open air, in warm weather. When varnish is exposed to sunshine it is apt to blister. If applied to cold or greasy furniture it "crawls," and settles down in ridges. When furniture does not take varnish well, rub it thoroughly with a cloth dipped in alcohol, or benzine. Then keep it in a warm room until all the wood has been well warmed through. When the varnish is being laid on let it be kept warm, by standing in a kettle of water nearly boiling hot.

Procure a small *varnish* brush, not a paint brush, for varnishing chairs, and take only a small quantity of varnish on the brush at once. Spread it evenly and thin, and work it well with the brush. When entirely dry, apply another thin coat. A beginner can do a much better job by laying on two thin coats than only one heavy coat.

There is a great difference in varnish that is sold for a given kind. Unless one has tested its drying quality, it would be well to try it on a piece of cheap furniture, to ascertain whether it will dry well. Varnish that will stick to everything that touches it, is a vexatious nuisance. Let such varnish or paint be rubbed thoroughly with good benzine, and afterwards two coats of good varnish applied.

Walls that have been papered, may be varnished after a thin coat of glue-water has been applied to keep the varnish from striking into the paper. When varnish is laid directly on the paper, most of it will be absorbed, and there will be little gloss.—*Am. Agriculturist.*

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 25th, 1865.

It is still difficult to negotiate anything but prime paper. and that for the most part must be free from the taint of mining stock speculations. Although there has been a determination of late to hold in check the flood of mining paper, in one form or another, with which the market has been deluged, and to restrain the spirit of speculation which in times past has often pushed this interest into a position perilous to itself and to other important interests among us, there is now rather more disposition to accept certain mining shares as the basis of loans, and a number of negotiations of this character have been made during the week. The current rate in bank is 1¼@1½ ₱ cent. per month.

The receipts of treasure since our last reference have reached $1,300,000, making an aggregate of $3,400,000 thus far during the current month. The market is not largely supplied with bullion, but the demand is light and sales of gold bars have been made at 830@840. Silver is held at ¼ ₱ cent premium to ½ ₱ cent discount.

An important rally in all mining shares was inaugurated at the close of last week, and the movement continued for several days, when a stampede took place and every stock on the list met with a decline.

Since then the market has evinced rather more steadiness, with a tendency to higher figures for some stocks. Advices from Nevada are thought to be rather more encouraging with respect to the future of certain claims, and it is stated by those who ought to be well informed, that a prominent banking institution in this city (upon whom many parties usually rely in the negotiation of their stock collateral loans), is again extending its favors in that direction, with, however, more discrimination than formerly. City stocks are for the most part held with firmness, but a decline in some shares may be noted.

California Steam Navigation fell from $68 to $60, seller 30, rallied to $65, then sold at $70, and closed at $69 asked. We are authorized to state that this Company have bought of Mr. J. B. Dickinson the screw steamships Ajax and California, both of which are to be actively employed in the coast trade. These vessels are new and of the most substantial character, and it is believed that their purchase will not interfere materially with the regular dividends of the company. owing to the large surplus on hand. The disbursements required for the first installment due upon these ships, will serve to explain why the last dividend was paid in Legal Tender notes, but it is likely that no more will be made in the same kind of funds.

Gould & Curry rose from $850 to $920, then sold at $950, and closed at about $975 asked. Their mill has recently been crushing an average of 120 tons of ore per day, and outside mills are reducing about 20 tons daily. The annual report of this company will, it is thought, present some encouraging features as to its present condition and future prospects. The suit instituted in this city a short time since by the Seneca Company, against the Gould & Curry claim, so far as we can learn, is of little or no importance. The Seneca Company was perpetually enjoined a short time since, and made no appeal from so effectual a disposition of their case by the courts of Nevada. The North Potosi, and Bajazette and Golden Era suits against the Savage and Potosi companies, it will be remembered, were analogous cases, and the attempt to revive, at this time, a similar cause of action against the Gould & Curry Company is, to say the least, a very peculiar proceeding.

Alpha rose from $680 to $950, receded to $815, rallied to $820, seller 30, dropped to $790, sold on Thursday at $800, and closed at $860. Recent developments in the lower level are favorable, and it is thought that a large body of good ore will soon be disclosed in that portion of the mine.

Savage has been actively dealt in, and some 50 feet were sold, advancing from $620 to $775, buyer 30, receding to $640, then selling at $670@655, and closing at $760, assessment delinquent. The repairs to the shaft were completed an Tuesday last, and since then an average of some 200 tons of ore per day have been hoisted to the surface. Arrangements have been made with outside mills to crush 150 tons daily, and the Minnesota mill will also reduce about 25 tons per day. The financial condition of this company is now about as follows: Immediate liabilities, $231,000; due upon the Minnesota mill, $40,000 in monthly installments of $5,000 each—in all $271,000. From the recent assessment $70,000 will yet be received, reducing the actual indebtedness of the company to about $200,000.

Yellow Jacket was in decided request early in the week. and rapidly rose from $545 to $750. buyer 20, then dropping as suddenly to $580, rallying to $600, selling on Thursday at $595@$565, and closing yesterday at $620. The southwest drift is said to have met with a deposit of good ore, and in the north end of the mine very rich ore has been found this week. Drifting has begun in the different levels from the new or south shaft. During the week ending November 6th, 940 tons were extracted, and 630 tons were worked, yielding $17,969.62, or an average of $28.50 per ton.

Crown Point advanced from $750 to $830, fell to $700, seller 30, rallied to $720, and sold at the close at $760. During the week ending November 18th, 296 tons of ore were reduced by the company's two mills. In the lower level drift pay ore has been met with, and the indications are said to be favorable. The south incline on the west stratum is now down 64 feet from the 230-feet level, and the ore improving. The north incline is 59 feet deep, and also looks better. In the east stratum the incline has attained a depth of 46 feet, and the pay streak carries fine ore, but is narrow. From the north end of the mine above the 230 and 160-feet levels, some good ore continues to be taken.

Belcher fell from $400 to $295, rallied to $305, and sold yesterday at $320. Little or no progress has been made recently in the drifts from the two lower levels, owing to a continued influx of water. The debt of this company is now about $100,000.

Ophir rose from $340 to $415, buyer 30, then selling at $400, and closing yesterday at $395. Receipts of bullion during the first half of this month amounted to $32,863, and the indebtedness of the company is being materially reduced.

Chollar-Potosi advanced from $255 to $315, fell to $277½, and sold yesterday at $295@$292. During the week ending 17th instant, 330 tons of ore were sent to custom-mills, 208 tons were sold at $8 per ton, 46 at $7, and 109 at $5. In the Bajnzette ground the north drift is in 30 feet, and continues in good ore. The drift south, east of the pay seam, is also in 30 feet. and has run into good ore. The new developments on the south end of the Potosi, now communicate with the 5th station of the Chollar, and it is said that a large quantity of ore can yet be taken from that point. The drift from the new shaft is now under way. The total liabilities of this company now amount to some $250,000.

Empire Mill and Mining Company rose from $155 to $185, and closes at about $175. The drift, 139 feet west of the shaft, at a depth of 160 feet, has cut a vein of fair ore some 20 feet in width, in hitherto unprospected ground, and it is thought to reach within 30 feet of the surface. About 1,000 tons of ore will be hoisted this month mainly from that portion of the mine, and it is thought the company will be out of debt on the 1st of January next.

Imperial rose from $148 to $155, fell to $145, rallied to $152½, dropped to $138, and sold yesterday at $136@$131. Receipts of bullion this month show a material falling off as compared with same period last month.

Hale & Norcross rose to $170, fell to $155, and rallied to $200, again declined to $155, and sold yesterday at $205. Confidence was dealt in at $60@$62, closing at $60.

Overman rose from $38 to $58, fell to $52, rallied to $49, and sold at the close at $40.

Bullion advanced from $35 to $70, buyer 30, steadily declined to $42. and sold yesterday at $40. Exchequer has been dealt in within a range of $10 and $16, closing at $15. Sierra Nevada sold at $7@$6.

The aggregate sales of Stocks, since Saturday last inclusive, amounted to $772,340.

One month, per square	2 50
One quarter (3 months), per square	7 50

Advertisements of great length, or of special character, inserted by contract on the most favorable terms.

☞ *Ten lines of solid advertising type constitutes a square.* ☜

Terms of Subscription.

THE MINING AND SCIENTIFIC PRESS is published every Saturday morning (containing sixteen pages—size of *Harper's Weekly*) at the following rates:

One copy, one year, by mail, in advance	$5 00
One copy, six months, by mail, in advance	3 00
One copy, one year, by express	6 50
One copy, six months, by express	3 50
Five copies, one year, by mail, in advance	20 00
By city carriers, per month	50
Single copies	12½
Monthly Series (or parts), containing 4 Nos	50
Monthly Series, containing 5 Nos	62½

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

Just and True Economy
IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEE and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the paper of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, rendering our mining advertising, on every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

DEWEY & CO.,
4v11 Office Mining and Scientific Press.

POSTPONEMENTS.—We would again call the attention of Secretaries to a certain point of the mining law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

PRINTING FOR THE HOLIDAYS promptly executed in any style to suit tradesmen, at our JOB OFFICE, 505 Clay street.

Mining Summary.

CALIFORNIA.

BUTTE.—The Oroville *Record* of November 11th, says: There are several parties prospecting for gold-bearing quartz at Mountain Spring, and some rich lodes have been discovered. No less than five quartz mills will be erected in this township the next spring. A lead recently discovered near Lumpkins, assays, the best to $800, and the poorest to $90 per ton. Men have been at work on the Carlton Creek ledge for several years, getting out quartz and washing it in sluices, making good wages and saving the quartz. We understand that they contemplate erecting a mill on their lead in the spring. We may expect a lively time in quartz next summer.

PLUMAS.—The Quincy *Union* of Nov. 11th, says that considerable excitement has existed among the quartz men in that county during the past week, occasioned by the discovery of some very rich quartz in Mohawk Valley, near Fred. King's ranch. The ledge, or what is supposed to be the ledge, was accidentally discovered by a little boy named Wiseman, who, while playing, picked up some quartz containing gold, which he carried home, when Messrs. Wiseman and King went out and commenced prospecting near the spot where the specimen was found. They sank a shaft to the depth of ten feet, and took out some very fine specimens of gold-bearing quartz. They then located two thousand feet on the ledge. They intend crushing a few tons of the rock in an arastra.

The placer mines in this county are generally doing well. Messrs. Culp & Turner, on Indian Hill, are taking out a large amount of gold. At Sawpit, work is progressing finely. Some of the companies are taking out the richest kind of pay. On Twelve-Mile Bar and Rush Creek Flat, the miners are in good spirits—their claims are paying well. The Spanish Peak company is pushing its tunnel ahead, and is taking out some gravel which prospects very well. On the North Fork, the Cariboo is paying a half ounce per day to the hand. The Shamrock is doing equally as well.

BUTTE.—The Jefferson, of Browns' Valley, after another two-weeks' run, have cleaned up $12,000. The quartz at the bottom of their shaft still continues exceedingly rich.

NEVADA.—The Ophir mine, says the Grass Valley *Union*, is becoming fabulously rich. On Saturday last half a ton of rock was taken out, which, at the lowest estimate, will yield $10,000 to the ton.

The Union Hill company have just crushed eighty tons of rock, which yielded $1,800—$22 to the ton—an excellent yield for a vein seven feet in thickness.

The North Star is steadily sending in its weekly returns. They have recently worked into very rich rock.

The Norambagua mine, located at Forest Spring, has just crushed sixty-five tons of rock which yielded seveuty dollars a ton. The last crushing of the Heuston Hill mine paid $58.50 to the per ton.

Messrs. Scudder & Co. have recently refused $45,000 for their claim, offered by parties in this city. It is also said that Pratt & Co. have refused $50,000 for their claim.

The Nevada *Transcript* says, rock from the Eddy ledge, which is located a short distance north of Cayoteville, was recently crushed at Palmer's mill, and paid about $76 to the ton. The ledge is large and easily worked.

The product of the blue cement claims of Little York is continually increasing. New mills are being constructed, and new claims opened; and this increase will continue for a number of years. All that labor can do is being done in every kind of mining in this county. Capitalists are also becoming interested in this class of mining.

Excelsior.—The California mill, at the Excelsior mines, was started on the 15th instant. This is the first mill that has as yet got to work in the new mines. In a short time we may expect to hear good news from Excelsior.

PLACER.—The *Stars and Stripes* speaks of a very rich discovery at Doty's Flat. Mr. Walter, at the depth of thirty feet, has a twelve or fourteen-inch vein, which shows a large amount of free gold. He has, at several different times, taken a candle-box full of the rock to his cabin and pounded it in a hand mortar, with hut slightly varying results—the yield having been, in every instance, from seven and a half to nine dollars to the box-full.

Silver in Placer.—Mr. W. H. Ault has recently taken some specimens of quartz from the Pacific Silver Mining Company claim, near Newcastle, with which he experimented by placing it for a few minutes in a blacksmith's furnace. The experiment proved the rock to be exceedingly rich in silver, which was brought to the surface in innumerable globules. Portions of the rock also show an encouraging prospect of free gold. The lead of this company is located two and a half miles northwest of Newcastle, and near by another claim previously noticed by us, and also located for silver. These silver discoveries are creating quite an interest in that locality, and much prospecting is going on there.

EL DORADO.—The Placerville *Mirror* states that a very rich and extensive discovery of gold-bearing quartz has been made near Falling Leaf Lake, some seven or eight miles from Yank's Station, in the northeastern portion of that county. The lead is said to be twenty feet wide in places, and will pay $35 per ton. The lead is a geological curiosity, being situated exactly in the "gap," where the two formations of rock come together, so that the casing on the one side is granite and the other slate.

Such a location denotes it to be a true vein, and warrants its thorough development.

TUOLUMNE.—A correspondent of the Sooora *Democrat* says the following is a list of the quartz mills in Tuolumne county:

Excelsior mill, 10 stumps; Daegner's, 10 stamps; Soulsby, 10 stamps; Confidence, 10 stamps; Eureka, 20 stamps; Summer's, 10 stamps; Lambardo's, 10 stamps; Wheeler's, 10 stamps; Raymond's, 10 stamps; Summit Pass, 10 stamps; Shanghae, 10 stamps; Labetoure's, 10 stamps; Patterson's, 10 stamps; Rawhide, 10 stumps; Reesc, 5 stamps; Preston's 10 stamps; Golden Rule, 10 stamps; Heslip's, 10 stamps; App's, 10 stamps; Blue Gulch, 10 stamps; Snyder & Co.'s. 5 stamps; Bay State, 5 stumps; Jones & Woodman's, 10 stamps; River Side, 20 stamps; Monitor, 10 stamps; Pirate, 10 stamps; Buchanan, 10 stamps; Hunter, 10 stamps; Grizzly, 20 stamps—31 mills in all, with an aggregate of 325 stamps.

In addition to the above, there are also in process of construction the Zucarman mill, on Bald Mountain, 10 stamps; Rawhide mill, on the Rawhide ranch, 20 stamps; Consuelo and Bonita, on the north fork of the Tuolumne, 20 stamps each.

CALAVERAS.—The *Chronicle* says that recent developments show that in the Blue Mountain region we have silver-bearing lodes which will yet prove rich and inexhaustible; along the lower part of the county, running from Campo Seco to Copperopolis, are veins of copper which will build railroads and give employment to thousands of industrious miners; through the interior of the county are also gold bearing quartz leads, only waiting for the prospector and capitalist.

It is said that some Chilanos have discovered an immiensely rich quartz ledge oear Donallan's bridge, in this county.

The total shipments of copper ore from the Union mine for the week ending November 16th, was 531¼ tone. Owing to the late rain teams have been scarce during the past six days, and the shipments are therefore lighter than they otherwise would have been.

AMADOR.—The Jackson *Ledger* says that the "My Mary Ann" lode is prospecting remarkably well, and that the Anaconda continues to turn out ore as rich as ever. The owners have a large amonnt on hand that will average from fifty to sixty dollars to the ton.

A large pack-train passed through Jackson a few days ago, *en route* for Stockton. Each animal was laden with 300 pounds of quartz from the Pioneer mine, near Volcano, lately purchused hy C. T. Meader & Co.

TULARE.—Accounts of a highly favorable nature still continue to come in from the Clear Creek mines. The town of Havilah is rapidly growing in importance. There are four quartz mills now in operation there, running twenty-nine stamps, and twelve more in process of construction, which will aggregate 122 additional stamps.

VIRGINIA CITY AND VICINITY.

Nine hundred tons of Yellow Jacket rock were crushed at Birdsall & Carpenter's mill in 25 working days of last month, yielding $33.40 per ton. The Dayton *Sentinel* asks if any 20-stamp water mill ever beat this.

NYE COUNTY.—The mines of this county seem to be in active progress of development. There are four quartz mills in actual operation—one of 5-stamps at Washington; one of 10 at Ione; one of 10 at Silver Peak and one of 3 at Red Mountain. There are also several small prospecting mills done by horse-power. The mills in process of construction are four in number. All the ore of this district yields much better for heing roasted. The expense of crushing and roasting is now about $75 per ton for custom work.

Smelting works for reducing ore containing a large proportion of argentiferous galena, are now being erected about six miles southwest of Washington at the St. Helena mine. The aggregate of the metalliferous lands of this county are set down as equal to one-fifth its entire area. It is estimated that ubout $100,000-in bullion has been extracted during the past year, about eight per cent. of which is gold. There are numerous ledges of argentiferous galena in this county; also copper lodes. We gather the above items from the annual report of the county surveyor, as published in the *Territorial Enterprise.*

HUMBOLDT.

There appears to be an unusual degree of activity manifested by the miners of this district at the present time. We condense from the *Register:*

Black & Brother have sent for a small prospecting mill to oe put up on Zavala ledge; the rock they are taking out fully justifying such an investment.

Fall's mill is still crushing; but is unable to amalgamate by reason of a delay in receiving a lot of dies for the pans.

The Montezuma mine, by latest explorations, is fully up to all hopes. The ledge was carried for some distance down in the shaft, with nothing but barren quartz; but the mineral has come in again, as rich as ever, and about six feet wide.

The Chrysopolis mill at the upper end of the Etna is nearly ready to crush.

STAR DISTRICT.—Much activity appears to prevail in this district; large companies are employed exploring the mines, each with sufficient capital to fully develop and put in successful operation the several mines in which they are interested. The American Basin Company is building and thoroughly refitting the old Sheba Mill, for the purpose of reducing their ores. The Sheba Company, owning the mine and mill of that name, is working its ores at present by legal process.

TRINITY AND SACRAMENTO DISTRICT.—The mines in Sacramento District and the Arabia mines in Trinity District, are the great discoveries of the day in this region. The mines are described as of extraordinary development, so much so that the beholder can scarcely realize the fact that they are immense masses of silver bearing rock.

Arabia District is in a volcanic region. Granite crops out in many places in the vicinity of the ledges, but none of them, that we can remember, are cased in it—they being all in porphyry. The adjacent country shows evidence of recent and violent volcanic action, the hills to the north and northwest being composed of lava and igneous rocks.

A correspondent of the *Register* thinks it would be difficult anywhere in the world to find in the same compass so many ledges containing such immense quantities of paying ore.

ESMERALDA.

The Blind Springs district appears to be calling away much interest from Aurora and vicinity. This new locality is situated about fifty miles below Aurora and is pronounced one of the richest districts in the State. The ledges are numerous, of moderate size, well defined, and very rich. The Diana is the principal claim of the district. The rock contains no base metals, silver and copper alone being found, and is easily worked. They have a 4-stamp mill running on their second class rock, which pays $900 per ton. About 1,500 pounds of ore is worked per day, and twenty pounds of amalgam are daily retorted. The first class rock is sacked and shipped to England, $800 per ton being advanced at the mine. The ledges, generally in this district exhibit characteristics similar to the Diana, and mostly pay from the surface. Wood and water are abundant.

REESE RIVER.

We learn from the *Reveille* that 1,600 pounds of rock from the Pierre mine recently crushed, yielded $770. Fifty tons from the Whitlatch Yankee Blade cleaned up $11,775—equal to $230 per ton. The yield was within eight per cent. of the assay.

The Echo ledge situated in the Yankee Blade ravine, about five hundred yards west of the Whitlatch Yankee Blade mine, shows a good sized vein in regular walls, and yields an excellent quality of ore. The company has had several workings at the mill of the ore from this ledge, which in every instance, gave handsome returns.

The Cast Steel ledge, of the celebrated Vineyard group, lies about five hundred yards south of the Vineyard claim. An incline has been sunk on this to the depth of thirty feet, exhibiting a two foot vein. An amount of the ore has been worked at mill, yielding over $300 per ton.

The Emma Seymore, also regarded as one of the most valuable of the Vineyard group, and is located about 200 yards southeast of the Vineyard, and 300 west of the Midas mill. Ore from the vein has been assayed yielding over $450, and by mill process it has been worked as high as $250.

Fourteen tons of the Chase ledge, in N. Y. Canon, taken out by two men in ten days yielded $2,751. The Josephine, near by is opening remarkably well.

The Granite State, Wall Street, Katskill and Newbury is a line group of ledges near by, in the Yankee Blade ravine. The vein matter of these ledges consists of superior chloride and sulphuret ores. There are a large number of other promising ledges in this vicinity.

The Twin River Company (New York) are putting up a 20-stamp mill. The resident agent of the company is Mr. R. B. Canfield, and the working of the mines has been placed under the management of Captain Shears, an experienced miner, who was for several years connected with the copper mines of Lake Superior in the capacity of Superintendent.

THE NEW IDRA QUICKSILVER MINES.—The Company owning this valuable mine have not been working it for two years past in consequence of a protracted lawsuit. This having been at last decided, the Company have resumed operations. At the suspension of work the company were extensively in arrears with their workmen. Last month they paid an installment of 45 cents on the dollar on all such indebtedness, and will pay the balance next month. At the recent annual election of Trustees, the following persons were elected: Albert Dibblee, William Neely Thompson, C. O. Wardwell, W. H. L. Barnes and James Paterson. The Trustees subsequently elected, W. H. L. Barnes President of the Board of Trustees and of the Company, and C. O. Wardwell Vice President. The affairs of the Company are in a better condition than they have been for years.

IMMENSE SIZE OF THE PYRAMIDS.—A United States naval chaplain who has recently visited the great pyramid of Cheops, in Egypt, gives the following graphic idea of the immense size of these wonderful remains of antiquity. He says: Take a hundred of the New York churches of the ordinary width, and arranging them in a hollow square twenty-five on a side, and you would have scarcely the basement of this pyramid; take another hundred and throw in their material into the hollow square and it would not be full. Pile on all the stone and brick of Philadelphia and Boston, and the structure would not be as high and solid as this great work of man. One layer of block was long since removed to Cairo for building purposes, and enough remains to supply the demands of a city of half a million of people for a century, if they were permitted freely to use it.

THE MINERS AND MINES.—At the recent Colorado State Convention, the following resolution was adopted as part of the Union platform. It contains a just principle, and should be adopted by the Government:

Resolved, That the pioneer miner who explores the country, and finds the native deposits of precious metals, is entitled to the same, as the reward of his enterprise and daring, and that the General Government should give to the discoverer a title in fee to the same, at the minimum cost of survey.

TEA CULTURE IN GEORGIA.—A man who has been raising tea, as an experiment, since 1840, writes to the Savannah *Herald* that the most of his plants grow finely, that his tea is of good quality, and that the plants will do quite as well in Georgia as in their native country. The plants require no culture after the third year. If well taken care of, by that time they will be large enough to commence the manufacture of tea from them. The yield to the acre is from three to four hundred pounds, and the plants produce good crops for eighteen to twenty years. The growth of tea is not affected by dry or wet weather, or by storms, and insects will not molest the plants.

ORE SHIPMENTS FROM SAN FRANCISCO.—The British ship Surat, cleared from this port for Swansea, on Friday last, with 1,146 tons of copper ore, 55½ tons of silver ore, 14½ tons of gold ore, and 17½ tons mixed ores; total values $60,380, all but $13,350 of which was from California mines. This makes the eleventh vessel which has cleared from San Francisco for Swansea with ores during the last eight months

---

NEW YORK is to have another magnificent hotel, for which the site has been purchased near Central Park, consisting of a whole plat of ground. The building, with the grounds will cost $2,000,000.

Mechanical.

MIXED METALS.

In continuing our articles on metals, and their alloys and molecular changes, we are more than ever induced to express our wonder that so little attention has heretofore been paid by workers in metals and by chemists to the immense advantages that may be gained by judicious and skillful mixtures of those metals. We believe that facts will warrant us in the statement that there is no metal employed in the mechanic arts which cannot be improved, for any use to which it can be applied, by a judicious admixture with some other metal; yet, with all the boasted chemical and mechanical knowledge of the nineteenth century, it is only within a few years that we have been able to advantageously compound more than some half dozen simple alloys, nearly all of which were known equally as well to the ancients as to ourselves.

How few of the practical metal-workers of the present day, even among those who lay claim to considerable scientific attainment, have any particular knowledge of the chemisty of iron, the most common of all known metals. It is only quite recently that our chemists, even those who make it a business to study and experiment for the cause of science and the benefit of mankind, have directed any especial attention to this department of research. While the books are full of the records of their investigations upon the subject of *organic* compounds, they appear to have as cautiously avoided any contact with these *inorganic* substances, upon the employment of which most human industries are based, as though they were fearful of burning their fingers, should they attempt to meddle with hot and molten metals.

Perhaps the fact that nearly all students of science are very poor in purse, may have heretofore had an important bearing on the direction which their experiments have usually taken. Investigatons in the science of metals and their compounds is a very heavy, laborious, and expensive work; involving the employment of costly furnaces and other appliances, quite different from researches into the easily manipulated substances of organic nature. However this may be, it is only quite recently that any very especial attention has been turned in this direction; but the results from this new field of investigation are already of the highest importance and interest. So fruitful, indeed, has this field of research become, that we can now scarcely take up a scientific journal without finding something new with regard to some metal or metallic compound.

As examples of what have been already accomplished, we would refer particularly to the late discovery of Bessamer, and its successful application in the manufacture of steel; to the still later discoveries of M. Peloube, of the French Mint, with regard to the great superiority of zinc over copper, as an alloy for silver; also, to the recent successfully-conducted experimental researches into the advantages of tungsten as an alloy for hardening iron, to which we more particularly alluded last week, and last, though not least, to the practical results of the researches of Dr. O. E. Prieger, of Bonne, in Rhenish Prussia, into the utility and practicability of alloying manganese with iron and copper.

THE NEW ALLOYS OF MANGANESE WITH IRON AND COPPER.

The practicability of forming an alloy of manganese with iron was first made the subject of a patent, some fifteen years ago, and very important results were obtained. A new interest, however, has quite recently been awakened in this matter by the more elaborate and successful experiments of Dr. Prieger, who has also experimented largely with copper alloys of manganese as well as with iron. It is quite recently, we believe, that the Doctor has set himself resolutely at work, on a large scale, in efforts to devise and prove the practicability of cheaply alloying *manganese* with iron for the same purpose. His researches have been most abundantly rewarded; and it is announced that he is now able to produce, on a large scale, and very cheap, a quantity of cast-iron, *harder than steel*, which will take a most exquisite polish, of a color between that of silver and steel, and which will fuse at quite as low a temperature as ordinary cast-iron. This new alloy—new metal in fact—is said to be *entirely free from all liability to oxydization*, except when immersed in water; and even then the oxydization is confined to a slight action upon the surface only. The immense advantage to the arts of such a metal must be apparent to every mechanic. This discovery is also applicable to steel, but of the extent of its value in that direction we are not particularly informed.

Should the statements of the Doctor be borne out in the experience of others, this new alloy, which he terms "ferro-manganese," will soon come largely into demand. He has experimented with it in various degrees of mixture, from a fraction of one per cent. up to eighty per cent. He makes some very remarkable statements with regard to minor advantages derivable from a low percentage of manganese in the alloy; but he considers the alloys most likely to be of the greatest benefit to the arts to be two; which contain their constituents in atomic proportions; one of which is made up of two atoms of manganese to one of iron, and the other of four atoms of manganese to one of iron. The percentage proportions of manganese in these two alloys is given, respectively, as 66.3 and 79.7. (We repeat the figures as we find them in the authority before us, although there is evidently a discrepancy somewhere.) Both these two last alloys are designed for cast iron, which, it is stated, is harder than the hardest steel, and at the same time as fusible as ordinary cast-iron.

STILL ANOTHER ALLOY.

The success of the Doctor in the production of his "ferro-manganese" induced him to try some experiments with copper. These have also proved successful, and he has named this second alloy "cupro-manganese." It resembles bronze, but is much harder, and more tenacious. This mixture, when further alloyed with zinc, is easily fused, without materially losing its tenacity; it also works very easily, and presents a color and lustre approaching that of silver. There is reason to believe that this alloy, also, in its varying degrees of percentage, will eventually become very useful, especially for artistic purposes. For the benefit of the reader who would like to learn more of the character and uses of manganese, in its various mineral and metallic forms, we have prepared an article, which will be found in another column, especially treating upon this interesting mineral, whose importance must be hereafter vastly increased, by the new properties which it has been found to possess, under the skillful manipulation of Dr. Prieger.

METALLIC CEILING.—While all other departments in the internal decorations of houses have kept pace with improvements in other branches of industry, it is a somewhat remarkable fact, and one that has long engaged the attention of architects, that the ceiling of our rooms, with their unseemly blisters and network of cracks, are still, generally speaking, just what they were many years ago. Mr. Little has invented a system for the construction of ceilings, which consists in the application of the joisting of very thin-stamped ductile metal in ornamental embossed panels, of such sizes and shapes as may be required. These stamped panels are fitted for every kind of decoration in color, and, if inserted as plain surfaces, may be used as the ground for every description of cartoon painting, combining with lightness and durability artistic and ornamental effect, at a comparatively small cost. Besides its applicability to the ceilings of rooms, and all public buildings, churches, etc., the system may be made use of with the same effect in staircases, halls, and porticoes, and even on the walls of the rooms.—*Ryland's Circular.*

THE rolling mills of New Albany, Ind., have a capacity for the manufacture of 130 tons of the best quality of round, flat, bar, and square iron per week.

FIFTY-NINE steamers, of over 1,000 tons burden each, have been built at New York within the last four years.

THE prices of labor, building materials, etc., now ruling in Cincinnati, and the West generally, are double those of 1860, but the *Gazette* states that the cost of living—food, rents, etc.,—has increased in a greater ratio than wages, and that workingmen have a hard time of it.

M. LENOIR, the inventor of the gas engine, has devised a kneading trough which is adapted to the gas engine, and which any journeyman baker can manage after half an hour's instruction. The mechanism performs exactly the work of the baker's arms, without the disagreeable accompaniments of the human machine.

PAPER MILL.—The Oregon *Reporter* says that a paper mill will soon be established at Oregon City. About $100 000 are annually sent out of Oregon for paper, which it is proposed to keep there by patronizing home manufactures.

IRON FURNACES IN MAINE.—A company of capitalists is engaged in erecting blast furnaces, near Bath, Maine, for reducing iron ore. It is estimated that the ore found there will yield about forty per cent.

THE Sultan has ordered machinery and engineers from England, to work the coal mines in Turkey, on his own account.

PROFITS OF THE EXPRESS BUSINESS.—The American Express Company of New York, in 1864, paid cash dividends to the amount of thirty-eight per cent. on a capital of $2,000,000, in addition to fifty per cent. in paid-up stock on an increase of its capital to $3,000,000; equal to *eighty-eight per cent.* for one year's profit on a capital that did not originally cost one half of its then fixed value! On its increased capital of $3,000,000, the same company paid, during the first eight months of the present year, twenty-six per cent. in cash, and twenty-five per cent. in additional paid-up stock, and a further cash dividend of twenty-five per cent. is expected for the balance (four months) of the year—over one hundred per cent. per annum on its actual paid-up capital!! The stock of this company, at last reports from New York, was selling at three times its par value. What wonder, then, that the railroads, out of whose legitimate business this profit is chiefly made, are taking steps to put an end to such a useless drain upon their business and the pockets of the people.

MANUAL FOR ASSAYERS.—One of the most valuable works for persons pursuing metallurgical studies, obtainable on the Pacific coast, is "Bodemann & Kerl's Assaying," for sale by A. Roman & Co., in this city. In fact this is the only really valuable work of this description accessible in California, and is just the thing needed here, where so many are now endeavoring to obtain a knowledge of assaying and the general principle of metallurgy, with the view of applying that information practically to the working of ores. This work treats on the assaying of gold, silver, copper, lead and mercury, and gives several methods of assaying by the wet way, not generally known even to old experts. In addition to the ordinary topics usually discussed in treatises of assaying, the work also contains many others of interest and importance to the student of metallurgy. The work is a translation from the German, by W. A. Goodyear, and is fully illustrated with plates.

SNAKE RIVER TO BE NAVIGATED.—The Salt Lake *Vedette*, of Nov. 1st, says that a steamer for this purpose is being constructed by Mr. Dorsey, at Old Fort Boise. The lumber of the craft is to be delivered on the ground before December 1st. The machinery is reported on the way from Umatilla. The steamer is to be 242 feet long. It is to run from Old's Ferry to Salmon Falls, a distance of 150 miles. The Idaho people are much rejoiced at the fact that they are soon to have steam navigation introduced upon that far inland water.

GOV. GOODWIN, of Arizona, now Territorial delegate to the Congress of the United States, left for Washington by the last Panama steamer.

SAFETY OF LIFE.

It is oftentimes astonishing to witness the small loss of life that results from a certain class of accidents, when one would naturally suppose the greatest danger would exist. How often do we hear of stages thrown off an embankment, and rolling down steep declivities where it would seem almost a miracle that any one could escape with life; and yet no other damage is done to the passengers than a few severe injuries. A wooden, or even a brick house, may fall and be pretty effectually demolished, with very little or no injury to the inmates. The distress is more in the anticipation than in the actual injuries received. A city may be nearly destroyed by an earthquake, and were it not for the fires that immediately break out in every direction, the loss of life would be comparatively small. The greatest loss of life is in churches, and other buildings where rooms of large areas are found, without supporting partitions. When an earthquake shock occurs in this city, it is the custom of the people to rush into the streets, where infinitely more danger exists than within the houses. It is doubly foolish to rush from a dwelling-house or store to avoid danger from an earthquake shock. In the first place, if there is actual danger, it will generally be upon you before you can get out; and in the second place, you are jumping from the frying-pan into the fire. If we were on Montgomery street, or in any place with tall brick buildings on either side of us, at the instant of the occurrence of an earthquake shock, we should be very likely to attempt to dodge inside of the most convenient doorway for safety. As an illustration of a portion of what we have said, our eyes have just fallen upon a paragraph from a foreign paper, where it is stated that a wooden theater recently fell in a small town in France, while nearly three hundred people were in the house; only two of whom were seriously injured, and those not fatally. If you are in a stage when it is upset, endeavor to keep as nearly in the middle of it as possible by holding to the seats. If you are in a house, when there is danger of its falling, place yourself near a partition, and as far as possible from an outside wall.

BURIED TREASURE.—It is said that a large amount of coin is beginning to make its appearance, most mysteriously, in many parts of the South. The solution of the mystery is that thousands of people, who were well supplied with coin at the outbreak of the rebellion, soon discovered that the Confederate Government would find it necessary to appropriate to its own use all the gold and silver it could find, and to save the remainder of their little fortunes, those who had twenty-dollar pieces and silver spoons, were compelled to secrete, or *cache* them. They were thus placed beyond the reach of guerrillas and taxation, and now that a more settled condition of affairs offers security to life and property, the buried treasures of the planters are coming to light. The government has taken the precaution to protect the people against acquisitive civil and military agents, and those who had the wisdom to lay aside their valuables in the midst of revolution for the return of better days, are bringing their treasures forth for the benefit of themselves and the public.

LOWER CALIFORNIA MINES.—A letter from La Paz, Lower California says that the mines in the San Antonio district are being developed very slowly; and this, notwithstanding several of these have been proven to contain valuable ore, in abundance. The complaint is that stockholders are unwilling to make the necessary outlays. The Triunfo company has a 2-stamp mill at work; but as yet pays no dividends. The company is in debt there about $36,000, on which they are paying from three to five per cent. per month interest. Their mine has every appearance of being a good one. The company has recently hired the Kenosho 4-stamp mill, and are offering to do custom work for $36 per ton, and guarantee within 10 per cent. of the assay. The use of sodium-amalgam has been introduced there; but with what success we are not informed.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

THE PITTSBURG RAILROAD—MOUNT DIABLO.

The construction of this railroad, which is being built to carry coal from the Mount Diablo coal mines to the steamboat landing on the San Joaquin, is being rapidly pushed ahead. Most of the grading is done, a portion of the rails are down and several cars are already on the track. Messrs. Booth & Co., of the Union Foundry, of this city, have the locomotive well under way which is to do the traction business of this road. It is to be a six-driver tank engine, to run without a tender—the whole weight of the engine and tank being placed upon the driving wheels. This locomotive is to be built to run up a maximum grade of *two hundred and seventy four feet to the mile!*—the highest grade, we believe, with one exception, yet overcome without a stationery engine. The road is five and one-quarter miles in length; the total elevation gained in the distance being *eight hundred and forty-seven feet*, as follows: First section, half a mile, level; second, one mile, seventy-five feet to the mile; third, one and one-quarter miles, eighty-five feet; fourth, three-quarters of a mile, 105 feet; fifth, one and three-quarters, 274 feet to the mile; 300 feet of this section passes through a tunnel which is already completed. This important enterprise has been commenced and carried forward, thus near to its completion, with very little stir; but with a degree of energy which augurs well for the future prosperity of the road and its management. The road will go into operation in about two months, just in time to keep up the winter supply of coal from that important coal mining region.

THE RAIN.—The late rain commenced most opportune, and continued just long enough to accomplish the greatest good with the least evil. Unlike the usual advent of the rainy season, which generally comes on in sparing installments, rendering it difficult to determine whether the miner should make immediate arrangements for winter's washing, or expect a month or two of half-way work; the present has come upon us with no uncertain import. Both the miner and the farmer can now go to work with a will, and with the full knowledge of a plenteous supply of the aqueous element. The ditches and rivers will be full from this time on for the miners; and the farmers can start their plows and get in an early crop, with the same prospect of an abundant harvest.

THE NEW METAL, MANGANESE, AND ITS ORES.

We have given in another column of the present issue an incidental notice of the progress recently made in reducing the mineral, manganese, to its metallic form; and the important commercial advantages which are likely to grow out of its use as an alloy for iron and copper. The experiments of Dr. Prieger, there referred to, and the fact that the ores of the metal manganese occur in almost unlimited quantities, even in the very Bay of San Francisco, to say nothing of its discovery in numerous other localities throughout the State, is considered of sufficient interest to warrant for it a more extended notice.

When the dark-colored mineral, known to commerce as manganese, was first discovered, and for a long time afterwards, it was called *black magnesia*, in contradistinction from magnesia proper, which occurs as a *white* mineral. The fact that this earthy base (black magnesia, now manganese) contained a *metal*, was made known, and that metal named magnesium, before Sir Humphrey Davy discovered that magnesia (the white mineral) could also be reduced to a metal. When it thus became known that both these two earthy minerals contained, each, a metal altogether different in their characteristics, it became necessary to make a change in their nomenclature, and the white mineral, with its metal, was thenceforth known respectively as magnesia and magnesium; while the name of the dark-colored mineral was changed to manganese. The term *manganesium*, the proper derivative name for the metal, is seldom used; but it is usually spoken of as "the metal manganese."

But first with regard to the mineral, which usually occurs as a black oxide. This mineral is in considerable demand for employment in the arts. It is almost universally used in the production of chlorine gas from common salt, for bleaching purposes. It has been considerably employed in this State for making chlorine in connection with the "chlorine process" for extracting gold from auriferous pyrites in Nevada, Grass Valley, in this city and in Mariposa and Amador counties. It is employed by glass manufacturers to destroy the green, olive and yellow tints which are almost invariably present in the compounds used for making glass. It has been and still is extensively used in this city in the manufacture of mineral paints. It has also been used to some extent in other parts of the world for mixing with paints and also in the manufacture of printer's ink. It is employed in a peculiarly prepared state, by calico printers, to produce what is called a manganese brown, or bronze. It is also sometimes, though rarely, used as a medicine for cutaneous diseases. Persons working with manganese, or in a manganese mine, are never subject to the *itch*.

It was estimated, some ten or twelve years ago, that the annual consumption of manganese, for all purposes throughout the world, was about 25,000 tons. The demand has greatly increased of late, and this rate of increase will doubtless hereafter be very much accelerated.

A very fair quality of this mineral is found upon Red Rock, a well known island about ten miles up the Bay, from this city. The island, we believe, is almost or entirely made up of this mineral. Large quantities are brought to this city for various purposes. Some thirty or forty tons were shipped to New York, last winter, by the ship Cremorne, with the view, we have understood, of proving its value for being refined for commercial purposes. We have not learned the result of the speculation, although there is little doubt of its success.

Manganese is never found native. It always occurs as an ore—in oxyds, carbonates, sulphurets, etc. The metal manganese is dark grey, in color, very brittle and exceedingly hard, even scratching steel. Isolated or alloyed, it possesses many very remarkable characteristics. It is almost impossible to obtain the metal direct from its ores, in an isolated condition. It is obtained, for commercial purposes only as an alloy, formerly with iron alone; but latterly with copper as well. It can be obtained as a free metal, only in small buttons and with the aid of a great heat, kept up by a hot blast. It is even then very impure, resembling pig iron, and much contaminated with carbon and silicium. Its carbon may be separated by fusion with borax, when the metal is extremely oxydizable; so much so that it must, like sodium, be kept under naptha. Notwithstanding the metal is so easily oxydizable of itself, yet when alloyed only to the extent of fifteen or twenty per cent. with iron it is next to gold in resisting oxydization; and will retain a bright polish for an indefinite length of time. Another peculiarity of this metal is the fact that while in the condition of a free metal, it requires the strongest attainable furnace heat to melt it; when it is alloyed with iron, even to an extent which constitutes eighty per cent. and more of the alloy, it is as easily melted as ordinary cast iron. When combined, by fusion, with five or six per cent. of silicium, it will not oxydize even at a red heat, and withstands the action of nitro-hydrochloric acid.

The remarkable changes in its properties which this metal undergoes, with so slight foreign admixtures, is deemed by some chemists as unaccountable, except upon the supposition that it possesses an allotropic character; a condition in chemistry applied to any substance which possesses the power of existing in two or more conditions, entirely distinct in their physical relations. To illustrate—carbon is an allotropic, elementary substance, inasmuch as it occurs extremely hard in the diamond, in octahedron crystals; while it is also found quite soft, as graphite, in hexagonal crystals, and very soft, as lamp-black, in an amorphous state. Oxygen is also allotropic, being identical in element with ozone.

The method adopted by Dr. Prieger, for obtaining the alloy of this metal is by taking the oxyd ore, finely pulverizing it with charcoal and mixing this mixture with pulverized cast iron or iron turnings, and placing this triple mixture in a graphite crucible, holding thirty or forty pounds, cover with carbon and salt, and expose for several hours to a white heat; on cooling there will be found a homogenous alloy of manganese and iron. The molten iron seizes the particles of manganesium, as fast as they are set free, preventing their combining with the carbon, or becoming instantly oxydized again, as they would do if the iron were not present. Dr. Prieger has already produced some hundreds of tons of this alloy, by his improved process.

NOTE.—In the paragraph treating upon this alloy, on page 327 of this issue, the last line but one in the column, for "the same purpose," read "commercial purposes."

A. ROMAN & CO.—We would invite the attention of our readers to the card of this enterprising House which appears in our present issue. This is the only firm in the State devoted exclusively to the book trade, and the amount of business which they transact proves this to be a country in which such a business may be made highly profitable. Among the publications in which the mining community will be particularly interested may be mentioned, Kustel's Metallurgy, of which Messrs. R. & Co., are now sole publishers, besides a long list of works on natural science, mining, agriculture, and petroleum, on which last subject a large number of books have lately been published in the East, and all of which can be obtained of Messrs. Roman & Co. They have just received one hundred and fifty cases of standard works selected by Mr. Roman in the eastern markets, including Historical, Religious, Scientific and Miscellaneous works of every character. Their long experience and high character for enterprise and integrity, warrant us in assuring our friends in the interior that by sending their orders for books to this firm they will be filled as well and promptly, and at the same price as if they were personally present. Do not forget the address, A. Roman & Co., 417 Montgomery street, San Francisco, where you will find one of the largest stocks of standard and miscellaneous books on the coast, selected with special reference to the California trade.

A NEW AND CONVENIENT HITCHING POST. It has often been noticed of California inventors, that they always appear to bring out precisely the invention that is wanted and that, too, just at the proper time. In other words they do not invent for the mere novelty of the thing, or go into the business for the sole purpose of making money. Their inventions are usually brought out to meet a pressing, present want. Hence they are generally novel and eminently practical. We might mention a number of important instances where these remarks are peculiarly applicable. Our present purpose, however, is to call attention to the invention named in the heading of this article. A great inquiry has recently been made in this city for some kind of a "hitching post" which shall be no obstruction to the sidewalk; which shall be sufficiently elevated above the street to render it impossible for horses to entangle their feet in the halter, and which shall also possess the requisite strength and durability. Chief Burke, and the entire municipal government of the city, have been looking and inquiring for such a thing for the past three months, with the view of legislating it into general introduction in our principal streets, to prevent the frequent runaways, which almost daily place in peril the lives and limbs of pedestrians. As if designedly to illustrate our introductory remarks, just in the nick of time a gentleman of this city has invented precisely the thing needed—a hitching post which, when wanted as such, stands firm and erect for the purpose; but as soon as it is not needed, by a slight kick with the foot, *presto*, it suddenly drops out of sight, and all that is seen is a ring in the sidewalk, and ready to be pulled up again, by the next comer who may need it. The post consists of a wrought iron shaft, with a ring on the top, the shaft being inclosed in a box sunk underneath the pavement, where it remains out of sight when not in use. When needed for hitching horses it can be pulled up out of the box with the ring, and is kept upright by a spring at the lower end of the shaft, which catches on the edge of the box. Thus the objection to the ordinary hitching posts that they are an obstruction to the street is obviated, and all the advantages of a stationary post are secured. A sample will soon be exhibited on Montgomery street. In the meantime a patent has been applied for through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

THE BLUE LEDGE, EL DORADO.—This company has recently removed their mill from their former location, on the original Blue Ledge, to another mine, which the company has purchased about four miles distant, and about two miles from Spanish Flat. In changing the location of the mill important improvements have been made in its reconstruction, by which it is now believed to be one of the most perfect in the State, calculated for thirty stamps, twenty of which have already been put up, leaving the other ten to be added as they may be wanted. It is expected that the mill will commence regular crushing on Monday next. The mill is located directly upon the main vein (the company having two, one above the other), so that when it is properly opened, the rock can be delivered from the cars direct upon the platform of the mill. About 300 tons of rock have been taken out of this vein, some 100 tons of which have been worked with a yield of from $12 to $15 to the ton. The vein proper is about forty feet wide; but it is the intention of the company, for the present, to work only about seven feet from the west or foot-wall. It will be seen from the above that the cost of taking out the rock will be but a trifle, and the pay indicated, if continued into regular working, must be very profitable. The company intend to prosecute the work of development with the utmost energy.

COMPLIMENTARY.—We acknowledge the reception of a complimentary ticket to the seventh anniversary ball of the "Light Guard," which is to be held at Platt's Music Hall, on Thanksgiving evening, Wednesday, Dec. 6th.

CALIFORNIA PATENTS.—An article has been going the rounds of the California press to the effect that about 250 patents have been granted for California inventions during the last two and a half years. The fact is that not more than 250 *applications* have been made for the entire Pacific coast during the time mentioned. Of these, probably 150 have this far been allowed. Of the entire number of applications, a majority have been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Of the applications made through this office not more than one in twelve have been rejected; while taking all the States of the Union, the proportion of rejections is fully one in four, as may be seen from the annual Patent Office Reports. This fact proves one of two things, either that this agency is remarkably successful as solicitors, or that the inventors on the Pacific Coast are vastly superior to their brethren, generally, throughout the Union, in the originality of their mechanical ideas. We are willing to divide the honors; and attribute *our* superior success mainly to the fact that our business is usually done personally with our customers; which mode of doing patent business gives California inventors an immense advantage over those at the East who do their business with the New York agencies, through correspondence.

OIL SPRINGS IN ENGLAND.—The telegraph of Wednesday last reports the discovery of oil springs in England. All the petroleum hitherto obtained in that country, with the exception of a small spring which flowed for a short period in one of their coal mines, has been derived from distillation from bituminous coal. A patent was recently granted to Mr. John Watson, of London, for the manufacture of hydrocarbon oils from the upper and middle lias shales—a material not hitherto employed for that purpose, and ore which probably does not yield one-tenth as large a percentage of oil as that derivable from the bituminous sands of California, millions of tons of which are lying upon and near the surface of the ground.

THE EXCELSIOR GRINDER AND AMALGAMATOR.—Capt. Dall, one of the oldest and most experienced mill-men at Washoe, has had four of the above named pans in operation for the past two months, and recommends their use in the most positive terms, giving the Excelsior a decided preference. They carry an average charge of 2,700 pounds, reduce rapidly, yield satisfactorily, and are convenient in operation. This pan is one of the latest style patented by Messrs. Wheeler & Randall, of this city, and advertised in another section of this paper.

THE "A. A. SARGENT."—This new locomotive, the finishing touches upon which are being put on to-day at the Union Foundry, will be ready for the acceptance of the company on Monday. This locomotive, to which the name of our distinguished ex-Congressman has been given, has been built for the Central Pacific Railroad Company, and is designed to run on the same track with the "John Conness." This is the third heavy engine built at the Union Foundry.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embelishments to suit the various branches of industry in this State.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

To Delinquent Mining Companies.

We hereby give especial notice to the Secretaries, Trustees and Shareholders, of such Mining Companies as are owing us bills for advertising of OVER SIX MONTHS STANDING, that we shall commence action, according to law, to collect the amounts due, if the same are not immediately settled.

DEWEY & CO.,
Office Mining and Scientific Press, Nov. 25, 1865.

Notice.—The interest of E. D. Waters, Jr., in the job printing firm of Dewey, Waters & Co., has been purchased by A. T. Dewey. The business of the late firm will be continued under the title of "MINING AND SCIENTIFIC PRESS JOB PRINTING OFFICE."
San Francisco, November 18, 1865.

QUARTZ OPERATOR'S HAND BOOK.

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.
BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the completion of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 3th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice of a rival, if one, or any, application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of such notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees we have added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is now $20 in gold. If the case is granted no further agency expenses ensues. If the application is rejected we examine thoroughly into the reasons prescribed to the Commissioner for refusing the patent. In making this examination, we have at our command the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by conducting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted, the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, No. 505 Clay street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money can be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,
Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that of San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnasic Apparatus, which we most especially in the treatment of males, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The institution is furnished with an abundance of pure, soft water, from numerous springs; and we now offer to Ministers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantages of the only *rational* system of medicine, the hospitalities of our Hygienic Home and Cure. Young men who have become debilitated or lost their health by excesses, toil, exposure, or enervating habits, contracted through ignorance of Physical Laws, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of medicine, and the cure of all disorders, whether acute or chronic; that it is followed by none of those debilitating diseases, such as Phthisis, Chronic Diarrhœa, Torpid Liver, Constipation, Intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Urethal Strictures, etc., which we well know result from the free use of mercury and other metallic drugs, together with stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary

is by far the most complete in its facilities for the cure of all diseases commonly treated in all Eastern Water Cures of any note—establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Warm and Cold Wet Sheet Packs, the Electro-Chemical Bath, Steam Baths, Improved Sitz Baths, Douche Baths, a Patent Spray Bath, and a Magic Bath. The last named was introduced by Dr. Smith with special reference to the cure of those diseases peculiar to miners, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial, Lead, and Oak Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have yet used in eradicating all kinds of drugs and infections poisons, and in the cure of all disorders induced by exposure to dampness and water, foul air, absence of light and sedentary, retorting habits, the malaria of swamps and low marshy grounds. Where there was a fair constitution left, even when drugs had been applied for months and years without a cure, we have, in the past seven years, treated successfully the following diseases: Chronic, Inflammatory and Mercurial Rheumatism; Paralysis; Lung, Bronchial and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Erysipelas, Scrofula, Piles, Inflammation of the Bowels, Chronic and Acute Diarrhœa, and all diseases and weaknesses peculiar to male and females. No physician in California is so favorably situated to furnish so many home comforts and hygienic conditions that are indispensable to the speedy recovery of nervous and chronic invalids. We have the only truly healthful boarding place in the State for men, women and children, with plenty of saddle and carriage horses for the use of patients and boarders.

To that class of Diseases and Weaknesses peculiar to females, and the medication that Hydropathic or Hygienic physicians employ in their cure, do we invite the special attention of patients and their friends. The ease and rapidity with which females suffering from general or special debility, recover in the bracing climate of the Bay, under Hygienic Medication, together with the universal success that has attended the treatment of females at Dr. Smith's Institutions, (both in Sacramento and San Francisco) has induced us to make this class of human afflictions a specialty of our Institution. We have treated (mostly in the cure), over 300 females, several of whom had been "confined" for months and years, and all have been decidedly benefited, and with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former conditions.

There is not one female invalid in twenty that has been suffering from nervous debility or diseases peculiar to her sex, that cannot be permanently cured by spending from four to six weeks at our Water Cure, and using the exercises of the Gymnasium. This statement we make in confidence, from an experience of the last seven years. From the many who have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1858.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a regular Charter from the Legislature of the State of New York, and is authorized to grant Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has labored successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo-Therapeutic College.

To all whom it may concern:

I have known Dr Barlow J. Smith, both in our office as a Student, and a practical Phrenologist in the country, and from what I know of him, can cordially recommend him as an honest, faithful delineator of character, and as such I can cheerfully recommend him to the public.

For the good of Science,
L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets. Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH,
20v11tf San Francisco, Box 473.

Lost or Stolen.

There was lost, or stolen, from our collection of minerals, etc., at the Mechanics' Fair, a sample of the late Telegraph Cable. The lost piece is three inches in length, by one and one-sixteenth in diameter; brass ferrel on each end with raised letters, viz: "Glass, Elliott & Co., Contractors, London." Any person who will return the article to this office, or give information of its whereabouts, will be suitably rewarded.

DEWEY & CO.,
Publishers Mining and Scientific Press.

Calendars for 1866.—The MINING AND SCIENTIFIC PRESS JOB PRINTING OFFICE is prepared to execute every manner of Counting-house Calendars and advertisements for various business men, on short notice and moderate terms.

EXTRAORDINARY METEOR.—A fine meteor was seen about one o'clock on the morning of November 14th by persons in Stockton. It is described by the *Herald* as "a body of light varying from half a foot to a foot wide, and nine feet long, in the south, moving from east to west. It lit up the heavens so that a person who happened to be awake in the room at the time, thought the adjoining house was on fire. After its disappearance, its pathway could be traced by a clear line of light for nearly five minutes."

GROWING THINNER.—An exchange having said that portions of the Yosemite's boiler were no thicker than a piece of felt, another paper copies the item and inserts "cassimere" instead of "felt." The next one publishing it will probably substitute "gossamer" for "casmere."—*Ex.*

HEAVY BUSINESS AND IMPORTANT REVENUE. The sale of gold and stocks made by New York city brokers during the year ending the 30th of June last exceeded $6,000,000,000, yielding a governmental revenue of $3,500.-000.

A NEW TOY has been lately invented in Paris, which bids fair to supplant the roseate balloons so eagerly acquired by the children of the rising generation. It consists of a serpent composed of quicksilver, sulphur, etc., which, lighted by means of a common lucifer match and projected into the air, performs a series of marvellous evolutions.

ELEPHANT OIL is becoming an article of trade. A vessel is now on its way to Desolation Islands to get a cargo of the commodity.

Metallurgy.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott and Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

Boilers.

Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

Amalgamating Machinery.

Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills. Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

Oil Boring Tools and Machinery,

Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania.

We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron.

All work done in the best manner at the lowest cash prices. 21v10 **H. J. BOOTH & CO.**

Miners' Foundry

—AND—

MACHINE WORKS,

First St., between Howard and Folsom Streets,

The proprietors assure their patrons that the Lick House shall not be excelled in any of its appointments, or in polite attendance or attention to all the comforts of its guests. 15v11

HENDY'S IMPROVED BLOW-PIPE.

This Convenient Helpmeet

—TO THE—

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

MITCHELL'S COMBINED FAUCET AND MEASURE.

This is one of the most useful inventions of the day, and is destined to go into universal use on this coast, as it has in the Eastern States.

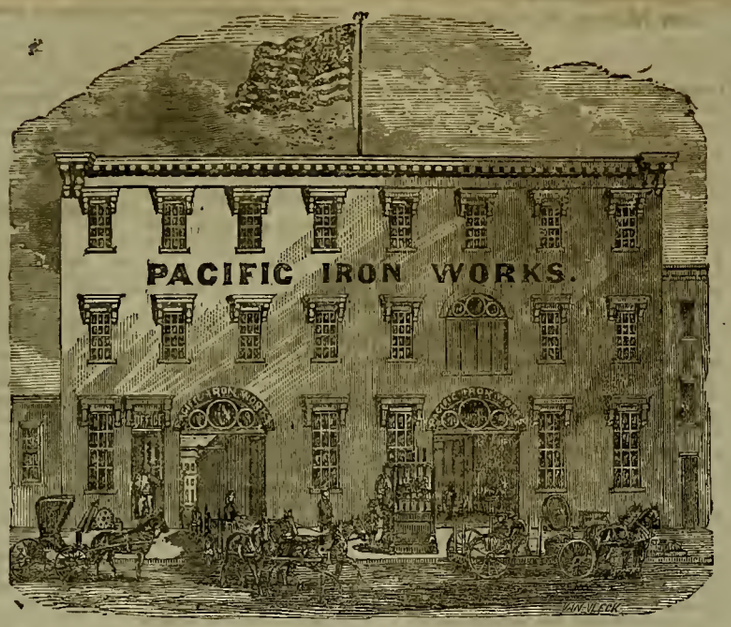
The invention consists of a combined Faucet and Measure, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the faucet itself. While it obviates altogether the use of measures, it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to foam up when drawn, as coal oil, linseed oil, etc.

The Proprietor has made arrangements with GALLAGHER, WEED & WHITE, of the California Brass Foundry of this city, for the manufacture of this Faucet, and is prepared to furnish the article or sell territories. Here is a chance for men with small capital to invest in a good business.

Residence, 320 Taylor street, near O'Farrell street.

D. C. MITCHELL, Prop'r.

San Francisco, Aug. 22d, 1865. 10v11-3m



THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Buttery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

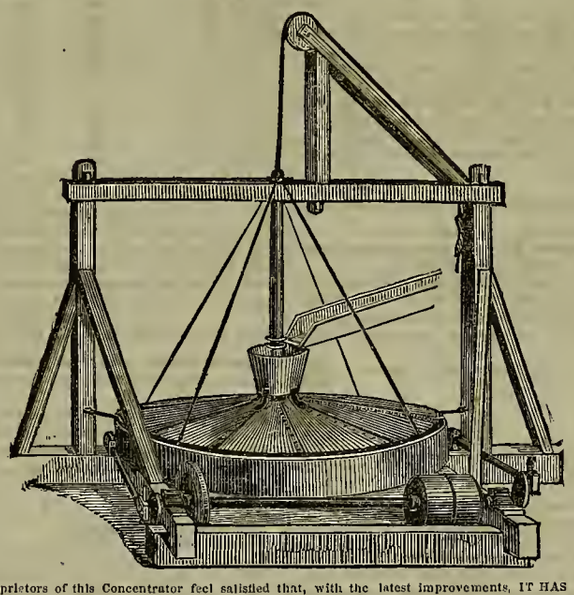
GODDARD & COMPANY.

GOLD AND SILVER ORES.

UNDENIABLE FACTS FOR THE MINING PUBLIC.

At the Exhibition in the Fall of 1864, the Mechanics' Institute awarded a Premium to E. B. PRATER,

FOR THE BEST CONCENTRATOR.



The proprietors of this Concentrator feel satisfied that, with the latest improvements, IT HAS NO EQUAL IN USE. Large numbers of these Machines are now in successful operation in different parts of this State, Arizona, Nevada, Colorado, Idaho, and Mexico. One of these Concentrators can be seen in operation at the San Francisco Foundry, northeast corner of Fremont and Mission streets.

The Prater Concentrator was invented at Washoe in the year 1863, and patented December 6, 1864; since which time it has got into successful operation, as above stated, and as an evidence of its worth, orders frequently come from those who have used them. The following telegraphic dispatch has just been received by the Fulton Foundry, from one that got a Prater Concentrator about four months ago:

Portland, Oregon, August 3, 1865.—Send one of Prater's Concentrators by first steamer. A. C RIPLEY.

Two Concentrators were ordered on the 26th August, 1865, for the Buell Mill, Austin, Reese River District, by J. R Murphy, who has been using them over twelve months

NEW BUSINESS DIRECTORY.—A. N. Rood & Co., recently commenced the publication of a Monthly Business Directory for this city, which contain some novel and useful features. It presents, in a neat pocket edition, a perfect business guide to most of the leading firms in the city, with an alphabetical index arranged in business classification. The work also contains several pages of useful information, such as the "Fire-Alarm Telegraph Stations," a "New Table of Stamp Duties," etc. The number before us contains eighty-six pages of printed matter, comprising one or more of the leading business firms in every branch of trade in the city; railroad and steamboat connections; ocean steamships, etc. The work is gratuitously circulated throughout the city and State. Important and novel features will be added from month to month, to render the publication novel and interesting. It is printed in the MINING AND SCIENTIFIC PRESS JOB PRINTING OFFICE.

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1864, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5.

And in accordance with law, and an order of the Board of Trustees, made on the 7th day of October, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on the 2d day of December, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

ROBT. P. LEE, Secretary.

Office, No. 434 California street, San Francisco. nov18

Simpson Mining and Milling Company, Mokelumne and Excelsior Districts, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of October, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable on the 31st day of October, 1865, in United States gold and silver coin, to the Secretary, at his office, No. 55 Montgomery Block, City and County of San Francisco, State of California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 16th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. CUNNINGHAM, Secretary.

Office, No. 55 Montgomery Block, southeast corner of Washington and Montgomery streets, San Francisco. nov4

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

Table Mountain Copper Mining Company, Stanislaus District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 1st day of November, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, in San Francisco, or to J. M. PIKE, Superintendent, at Copperopolis.

Any stock upon which said assessment shall remain unpaid on Saturday, the 2d day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 18th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, No. 436 Jackson street, San Francisco, California. nov4

United States Mining Company.—Location, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 15th day of November, 1865, an assessment of fifty cents per share was levied on each and every share of the capital stock of said Company, payable immediately, in gold or silver coin of the United States, to the Secretary, at his office, or to F. A. MARSTON, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on the 16th day of December, 1865, will be advertised as delinquent, and unless paid, will be sold on Saturday, the 30th day of December, 1865, to pay said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner Sansome and Washington streets, San Francisco, Cal. nov18

Wide West Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of November, 1865, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 30th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOSEPH OREEN, Secretary.

Office, 330 Davis street, corner of Washington street, San Francisco. no18

Wide West Mining Company, Esmeralda District, Esmeralda County, Nevada.

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of October, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at the salesrooms of John Middleton & Son, No. 404 Montgomery street, San Francisco, on Monday, the 4th of day December, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

J. P. DAVIS, Secretary.

Office, No. 103 California street, San Francisco. no18

Yuba Gold and Silver Mining Company, Brown's Valley, Yuba County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of November, 1865, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 210 Pine street, up stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 30th day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

P. R. RINGSTROM, Secretary.

Office, 210 Pine street.

N. B.—The above assessment is for the purchase of Machinery, nov18

Office Zenith Gold and Silver Mining Company, Mountain Rauch District, Calaveras County, California.

At a meeting of the Board of Trustees, held November 6th, 1865, it was "Resolved, That all previous assessments levied upon the stock of this Company, being

No. 1, September 24, 1863—25 cents per share;
No. 2, October 13, 1863—20 cents per share;
No. 3, December 2, 1863—30 cents per share;
No. 4, January 8, 1864—$1 per share;
No. 5, May 3, 1864—50 cents per share;
No. 6, August 15, 1864—50 cents per share;

be, and the same are hereby annulled and declared void, and that all moneys paid to the Company on said assessments be placed to the credit of the stock on which it was paid, and apply as a credit upon the next assessment levied by the Company. By order of the Board of Trustees.

M. G. ELMORE, Secretary.

Office, No. 7 Stevenson Block, San Francisco. no11 4w

Zenith Gold and Silver Mining Company, Mountain Ranch District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 6th day of November, 1865, an assessment of three dollars and twenty-five cents ($3.25) per share was levied upon the assessable stock of said Company, payable immediately, in United States gold coin, to the Secretary, No. 7 Stevenson Block, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the 9th day of December, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 23d day of December, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. O. ELMORE, Secretary.

Office, No. 7 Stevenson Block, San Francisco. nov11

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

PRESERVING TIMBER.—Announcement has been made of a new process for the preservation of timber. According to report it is applied to the trees before they are cut down, and renders the wood so hard, though newly felled, that its durability seems unlimited. The truth of the matter will shortly be tested, for the inventor is to supply a large number of railway-sleepers and telegraph posts warranted to last fifty years. And where is the railway company that could refuse to take such very durable timber into use?

WHY THE EGYPTIANS EMBALMED.—The Egyptians believed that at some future time the souls of men would be allowed to return to the resting places of their bodies, and if these last were in a state of preservation, there was a reunion and the enjoyment of a new state of existence. If the earthly tenement had been decomposed or destroyed, the spiritual essence was now doomed to perish. Hence the pious attention paid to the embalming of ancestors, and the judicial destruction of the dead bodies of those whose lives had been eminently wicked.

IT is curious to observe in how many of the lives of our great men there occurs the mention of some friend, unknown to the mass of mankind, to whom the great man acknowledged the deepest obligation. The world must abound in these secret springs and treasures.

IT costs twenty dollars a ton for transportation of merchandise per hundred miles on an ordinary road, two dollars on a railroad, and twenty cents on the ocean, for the same distance.

Deserved Testimonial.

GRIZZLY FLAT, Oct. 18, 1865.

MESSRS. HUNGERFORD & HENDY—*Gentlemen:* We have run your Concentrator for several days past, in our 5 stamp Mill, and, as far as can be ascertained at present, it is a perfect success. When running at the rate of from two hundred and ten to two hundred and twenty-five revolutions per minute, we have lost neither quicksilver nor sulphurets. Formerly, when using copperplate riffles and blankets, we found that in spite of the utmost precaution, quicksilver would escape over them all. Wishing you all success, we remain Your obedient servants,

E. A. BIGLER.

THE EXCELSIOR

GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

A VALUABLE MINERAL COLLECTION.—We find in the Tuolumne *Courier* a paragraph making note of the operations of Doctor Snell, who is increasing the size of his laboratory, and making other improvements about his premises. The *Courier* regrets that such a splendid collection of minerals and curiosities from every portion of the Pacific coast—unequalled by any other—should be exposed to danger in a frame building. It should be guarded with jealous care, in a fire-proof brick, for in a measure it is public property. The collection is composed of everything that could attract the attention of scientific men, or excite the curiosity of any one. Mr. Snell is now in his eighty first year, and as full of life and vigor as most men of forty.

In piling firewood put the bark side up. Wood piled with the bark down will not keep so well nor so dry as when the bark is upper most.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Nisnile Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperiences of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Ruggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the MINING AND SCIENTIFIC PRESS. 19v11tf

New Volume
— OF THE —
Mining and Scientific Press

Issued every Saturday. Each number contains 16 pages and 64 columns (size of Harper's Weekly).

PUBLISHED BY

DEWEY & CO.,

Patent Agents, Publishers and Job Printers
505 Clay Street, San Francisco.

THE ELEVENTH VOLUME

Of the MINING AND SCIENTIFIC PRESS commences under advantages most gratifying to its publishers, who assert, with pleasure, that a continued improvement in this journal may be anticipated by its numerous and rapidly increasing readers.

We shall continue to devote a large space in our columns to the various and best methods of treating ores and saving gold and other precious metals in every form, furnishing valuable hints to millmen, prospectors, oil-workers and miners generally, not to be found in any other publication.

New machinery, latest inventions and discoveries, and all matters pertaining to the mechanical, manufacturing and industrial resources of the Pacific States, will receive careful attention.

Stock market reports will be published as received from the official records. Our carefully compiled "Mining Shareholders' Directory" will prove a faithful monitor to parties holding stock, and a desirable record for reference to brokers.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and Newsdealers, acting as our agents, will receive liberal commissions.

Machinery.

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR
AND
SEPARATOR,
Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERATION daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The whole of the gold and amalgam is amalgamated on the copper plates; not a trace of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not affect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

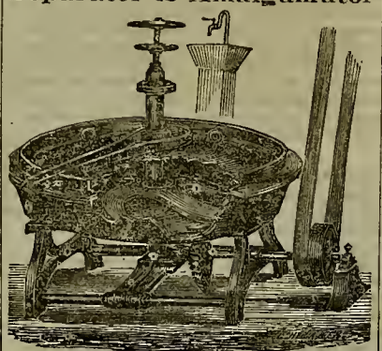
5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, ore concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,
Novelty Iron Works, Fremont st., San Francisco,
15v13-3m Or to E. T. STEEN, Agent.

BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson-ian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works, Miners' Foundry and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6tf

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
— AND —
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,
Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 864.]

HEPBURN & PETERSON.

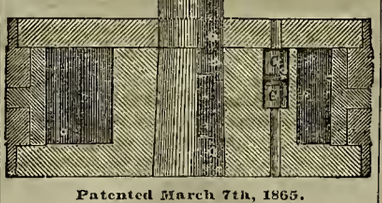
Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df **ANDREW STEVENS.**

SALMON'S
PROPELLOR AMALGAMATOR
— AND —
Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY, where Machines can be seen in operation. Address

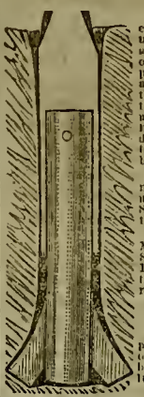
No. 1 Government House, cor. Sansome and Washington sts. 25v10 3m

STOW'S
PATENT CHAMBER DRILL.



The greatest Labor-saving Machine ever invented for Quartz Mining. By using this Drill in shafts, tunnels, and all other rock blasting, three-fourths of the labor and over one-half of the powder will be saved. The Drill makes a chamber directly at the bottom of the hole, at any depth you wish, six times the area of the original hole, in all kinds of rock, in less time than a man can drill a 2½ hole two inches deep. Requiring no tamping, it will be impossible to have a premature blast.

AT THE STATE FAIR held in Sacramento, September, 1865, a Committee, after examining both the Lincott's and Stow's Chamber Drills, reported as follows:

We, the undersigned, Committee on Mining Tools, do award to Henry M. Stow, of San Francisco, the FIRST PREMIUM for the best Chamber Drill for blasting rock, for the following reasons:

1st. For simplicity of construction.
2d. For durability of drill;
3d. For strength of drill.

The above Drills will be sent to any part of the State for $30, with one set of Cutters or Chisels that will chamber from 75 to 150 holes. Extra Chisels furnished at $2 50 per set.

The Drill may be seen at Mr. BUFFINGTON'S Office, No. 6 Government Block, corner Sansome and Washington streets, and at No. 511 Market street.

Drills will be delivered to any part of this State free of expense to the purchaser. Any information desired, or orders for Drills, address

STOW & COLLINS,
San Francisco

Oil Wells! Oil Wells!!

I received at the last STATE FAIR a special Premium for the best Expanding Drill for boring oil wells. The above Drill will bore the hole from ¾ inch to 2 inches larger than the inside of the pipe or tubing of the well, if desired, making the bore perfectly straight and round. The Drill can be attached to and work with any common drill at an expense of from $25 to $50. I will furnish all machinery for boring, or will take contracts for boring wells, and furnish steam engines and all tools required. Address,

HENRY M. STOW,
14v11 San Francisco.

WATER WHEELS!

Equal to the best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30¾. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth, and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,
At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ores are reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**
1v1 San Francisco.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,
24v9

QUERY—As to whether "Honest Miner" and "Cosmopolitan," correspondents of the *Bulletin*, ever meet in the street without recognizing each other?—*Call.*

If permitted, we would express the opinion that when either "Cosmopolitan" or "Honest Miner" looks into the glass, the one invariably sees the other, and *vice versa*. Somebody has been smart enough, the past week, to get three or four first rate advertisements out of the dailies, as cheap as the seats are offered to the "Honest Miner," or "any other man" in the 'Central Church," at "Congress Hall." Hope we don't intrude.

PATENT RIGHT FOR SALE.—The exclusive right for the manufacture and sale of "Hutchinson's Wine and Cider Mill and Press, for the States of California and Oregon, is advertised for sale in another column. It is a valuable patent, and the offer affords a fine chance for business.

Traveling Agent.

MR. ROBERT LATTIMORE is now on a canvassing tour for the PRESS through Butte, Colusi, Tehama, Shasta, and Siskiyou counties, and we recommend him to the favorable consideration of our friends.

To Publishers.

An editor and practical printer, of good experience and recommendation, desires a situation and will accept a moderate salary on trial. Address this office.

OUR NEW YORK AGENCY.

MR. GEO. M NEWTON is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "STOCKHOLDER," **No. 72 William street.**

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, MR. TURNER HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where samp copies of our publications can always be found.

RUGGLES' PRINTING PRESS

For Sale or Exchange.

The Proprietors of the MINING AND SCIENTIFIC PRESS have on hand a Half Medium Ruggles Engine Job Press, in condition good as new, which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

DEWEY & CO., Job Printers,
Office, 505 Clay street.

New Invention.

ROSENFIELD'S PATENT SAFETY WHIPPLETREE—the greatest thing out. The attention of all owners of Horses and Buggies is called to this valuable LIFE and Buggy saving invention, and which can be attached to all buggies and vehicles without any changes in the harness or buggy, and can be easily secured to any carriage in fifteen minutes. The great value of this Whippletree is, that a runaway horse can be instantly detached from a carriage without taking any portion of the vehicle. The public are invited to call and see it, and orders for the Whippletree left at No. 420 California street (northeast corner of California and Leidesdorff streets), Room No. 1, from 10 A. M. to 5 P. M., will be promptly attended to. Letters dropped through the Post Office, Box 1,944, will be promptly and fully answered. 18v11-1m

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

Pacific Mail Steamship Co.

The following Steamships will be dispatched on the following named days.

Nov. 30th—GOLDEN CITY....Capt. Geo. H. Bradbury.
December 9—COLORADO.....Capt. Jas. T. Watkins.

From Folsom street Wharf
At 11 o'clock A. M., punctually to the hour.

For Panama.

Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York by the Atlantic and Pacific Steamship Company

A Baggage Master will be sent through each trip.

Cabin passengers will be berthed for Atlantic steamer.

JOB PRINTING OFFICE,

505 Clay Street,

(Southwest corner of Sansome street, on 2d floor,)

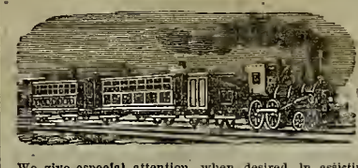
Formerly WATERS BROS. & CO.'S.

We are now prepared to offer customers the most favorable inducements to patronize our Book and Job Printing Establishment. Our office is supplied with an EXTENSIVE assortment of Type, and the BEST style of Presses for good work and

CHEAP AND RAPID PRINTING.

Patrons will always find us well up to the times, ready to execute superior work, and furnish the same as cheap as any prompt and reliable firm in San Francisco.

Our aim is to SUIT OUR CUSTOMERS in regard to style and prices, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

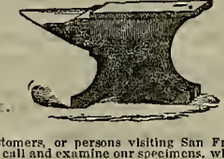


We give especial attention, when desired, in assisting parties in making up or revising their copy. Particular care will always be given to the publication of

LAW BRIEFS,
CERTIFICATES OF STOCK,
MISCELLANEOUS BLANKS,
BLANK BOOKS,
MINING BLANKS,

BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages can be forwarded by mail at small expense.



City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

1852. 1865

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,
"THE FAIR LILIAS;"
Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,
"OUR MUTUAL FRIEND,".....By Charles Dickens.
"THOUGHTS AND THINGS"
APPEAR WEEKLY IN THE GOLDEN ERA.

Read "Thoughts and Things" in the GOLDEN ERA.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

PIKE'S "LITTLE GIANT" QUARTZ MILL.

We give annexed a finely executed illustration of Mr. S. B. Pike's improved "Little Giant" Quartz Mill, showing, in detail, all its parts and the mode of operating the machine. The particular end kept in view by the inventor, in devising this machine, was such a combination of working parts and power, as would secure a practical dry crusher, combining the grinding and pulverizing principle of the Chili mill without its slowness, with the striking effect of the stamps; the whole admitting of a free discharge without the possibility of packing; and all this with a perfect confinement of the dust usually so detrimental to machinery and injurious to health, where dry-crushing is employed.

DESCRIPTION OF ILLUSTRATION.

AA, represents the wooden frame or support of the machine. BB, a circular disk, having a recess for the reception of an annular ring, or die, C, made of white iron. D, an adjustable gutter. E, a scraper on C and fitting D.

FFFF, four flat faced rollers, resting on C. G, white iron ring on F. H, horizontal bar and hub, having a vertical motion in boxes KK. J, Spindle of F revolving in H. LL, adjustable guides suspended between rollers FF and near disk C. M, upright shaft, supporting BB. N, step. O, driving pulley. P, hopper. R, gear. S, pinion. T, cylindrical bolt. U, conveyor. V, crusher. WW, keys. X, binders for adjusting D.

On revolving the disk BB rapidly, which transmits motion to FFFF, the ore, which is fed on to the center of the plate B, is by its own inertia and the centrifugal force of the plate, thrown rapidly off of the plate B into the gutter D, passing in its course under the rollers F, either before or after it has received a change of direction from the guides LL, and so regular as to form no cushion between F and C. From the gutter D it is removed by the scraper E into the cylindrical bolt F, from whence that which will not pass the seive is returned to be re-ground by the conveyor U. The top and sides of the machine are inclosed inside of all journals and bearings.

The arrangement of the bracket H and boxes KK, admits of the rollers F keeping an even face and conforming to the surface of the plate BB and die C. The plate is intended to revolve some 42 revolutions per minute, which gives a crushing effect of over ONE TON on the face of each roller, or 100 *pounds per square inch*, allowing the impact to be on two inches of the circumference and across the whole face of the roller at once.

A stamp weighing 650 pounds, with 6 inches diameter of face, and falling one foot, has a striking effect of 46 pounds to the square inch, and this effect is usually greatly reduced by the cushioning or packing of the ore in the mortar, resulting from an imperfect discharge.

The proprietor of the "Little Giant" states in his circular that he is now prepared to build complete or furnish the iron work for these mills at short notice, and guarantee them to crush, without a crusher, 1,000 pounds per hour, from the size of an egg to dust that shall pass through a sieve of 5,000 meshes to the square inch, the power required being from five to eight horse. With a crusher in connection, as is represented in the cut, he claims that this mill will crush one ton per hour, having tested it practically on the hardest kind of quartz.

In offering this mill to the mining public, the inventor submits the following:

First.—It will do more work with the same amount of power than any other machine now in use for dry crushing and pulverizing.

Second.—Its weight being but some four tons and its largest piece not weighing over 1,000 pounds, allows of its being easily transported into the new and mountainous districts of the interior, at a small expense compared with the ponderous machinery now in use.

Third.—Its first cost enables prospectors and men of moderate means to have a mill of paying capacity without the expenditure of a fortune.

Fourth.—The white iron die on the plate and the rings on the rollers—the wearing parts of the machine—can be easily replaced at a trifling expense.

Fifth.—Its grinding parts are entirely inclosed, thus securing the dust and obviating the great objection to dry crushing.

Sixth.—Its journals are all remote, and protected from dust and grit, thereby preventing any cutting or heating of parts.

Seventh.—It is self-feeding and self-discharging, requiring but one attendant to feed the crusher.

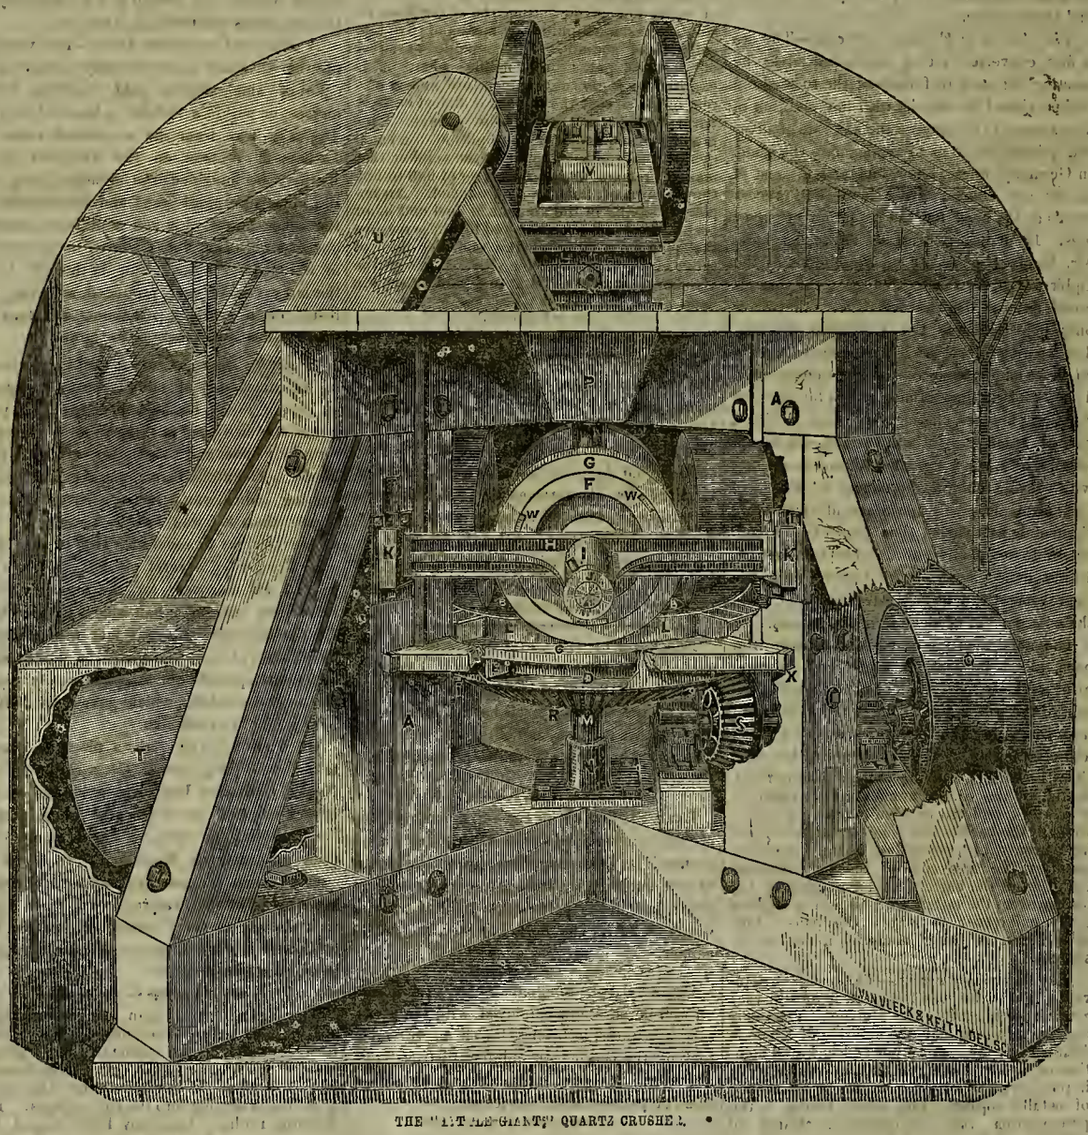
Eight.—It will reduce ore to any required degree of fineness, and can, at the option of the mill men, be made to grade its ore suitable for concentration.

Ninth.—By the use of a roller with a flat face, a slip on its inner edge is had, producing a grinding and fine pulverizing effect.

Tenth.—By its feeding and discharging itself rapidly by centrifugal force, all packing and cushioning of ore under the rollers, which is so detrimental to a rapid pulverization, is prevented.

Eleventh.—By the use of wings or guides between the rollers, all of the ore is passed under these before it can leave the plate.

Twelfth.—By revolving the bed on which the rollers rest, a centrifugal striking force is had on the face of each traveler, which increases in proportion to the square of the velocity attained, and consequently its grinding effects are increased in the same ratio.



THE "LITTLE GIANT" QUARTZ CRUSHER.

SHERMAN DAY, together with a number of assistants, is now engaged in surveying a canal for the Natoma Water and Mining Company, to convey the water from the American river to the town of Folsom, on a level with the town, for manufacturing purposes. This, says the *Telegraph*, is a step in the right direction, and will tend directly to make the water power here available, and make the town, as it should have been years ago, the great manufacturing center of the State.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction—A General Review—No. XIX.

BY PROF. L. LANSZWEERT.

The Hungarian Process.—Among the various processes for reduciog silver ores applicable to Washoe, we may mention the old Hungarian process. The ore is hoiled in iron pans, with salt, alnoi, nnd saltpetre, convertiog the eulphides into chlorides, the latter being reduced, hy the iron of the pan, to metallic silver. Quicksilver is theu added to amalgamate the réduced silver.

Partode's Process.—The ores are roasted with salt, and the chloride of silver is dissolved in ammonia, from which the silver is precipitated by sheet-iron. The ammonia is distilled and used again.

Gurl's Process.—The crushed ore is converted into a chloride, in barrels, containiog seven per cent. of chloride of copper and salt water. The chloride of silver thns formed is separated from the eolution, and the silver precipitated by copper. The solution of salt and chloride of copper can he nsed eeveral times. Poor ores can he extracted by this process where fuel is expensive.

The Barrel or *Freiberg Process.*—The ore is first converted into a chloride of silver hy roasting the same in furnaces; the roasted ore is then placed in harrels, with the addition of irou scraps, to decompose the chloride of silver and quicksilver, so as to amalgamate the same. In Germany, where labor, fuel, and interest of money are comparatively low, this process stands at the head for the reduction of silver oree. By one of its earliest advocates here, Mr. Guido Kustel, lnte superintendent of the Ophir works, it was decided that the harrels could not be dispensed with, and that their only objection was the expensive roasting. The roasting of ores is a difficult science, and, in all silver-miuing countriee, of great importance. There are two kinds of mechanical furnaces for roasting purposes, offering very economical and perfect roaeting. In both cnses steam is applied, which, when snperheated, and in contact with volatile chlorides, produces a change of their elements, giving muriatic acid, and leaving the metals as oxides; thus preventing n considerahle loss of silver and gold by volatization. Iu the employment of the barrels very little improvement can be suggested, unless it be in the enlargement of the size of the harrels.

The amalgamation of roasted ores in irou pans, aided by heat, is n decided improvement on the harrel system; as the action of the iron of the pan is equivalent to the addition of iron scraps to the roasted ores, nnd the filling and cleaning-up of the pans requires less time than the barrels, and the amalgamation itsell, heated hy the direct npplication of steiin, is generally completed in from four to six hours; while in the barrels the amalgamation requires from tweuty to twenty-four hours. Notwithstanding the first cost of the pans is larger than that of the harrels, the advantages of the former over the latter are sufficient to induce every mill-owner to adopt the pans. This snhstitution is heiog made in numerous instances.

The Augustin Process.—This process was invented ahout the year 1845, and is now in very geueral use in Saxony and Hungary. The ore is roasted with salt, nud the chloride of silver is dissolved by means of a hot concentrated solution of common salt; this solution is then put in proper vessels for precipitation by the ageucy of metallic copper. The silver falling in the precipitation tuhs is collected, cleared of particles of copper by hydrochloric acid, and the acid, after remaining on it some time, is washed off by pure water, when the silver is collected, placed in iron pans to dry, and finally cast in bars. (See, for a full description of this process, Mining and Scientific Press, April 9th, 1864.)

Ziervogel's Process.—This method was invented by Huttenmeister Ziervogel, of Heltstedt, near Eisleben, in Prussia. The same lode in which the father of Martin Luther wrought as a miner, fnrnished the ore for the earliest experiments in this process, and still furnishes the Gottesbelohnung furnace. The name of the inventor may not be unfamiliar to the ears of many of your readers, since he was for several years the director of a coal company upon the Lehigh, in Peonsylvania.

This system of extracting silver from its ores is hased upon the translormation of the sulphide of silver ioto the coodition of a sulphate. This ie done by roasting the sulphide with great care in a reverberatory furnace, and exposing it to the action of a draught of air from the surronndiog atmosphere. The roasted matte, after having cooled sufficiently, is subjected to lixiviation, when water, heated to 130° Fahrenheit, is allowed to penetrate the mass, and carries with it such soluhle salts as it may find present, among which the sulphate of silver is the most important. The silver-holding finid, after beiog strained through a filter, lalls into a vessel, where its earthy impuritiee are allowed to settle to the bottom. From thence the clear liquor is ron into a tnhe containing granulated eopper and blistered copper hars. Here, on account of the high electro-positive character of the copper, the silver is precipitated in the form of a fine crystalline powder, known as cement silver, which is collected, washed with water to carry off the sulphate of lime with which it is mixed, and with acid to clear it of particles of metallic copper. It is then fused in a peculiar reverberatory furnace, and produced at a fineness of 980 thousandths. (For further description of this process, see Mining and Scientific Press, April 23. 1864.)

Von Patera's Process, or Silver Extraction hy Hyposulphite of Soda.—This process consists essentially in the transformation of the silver of the ores into a chloride, by roasting with common salt, and a snbsequent dissolving out of the same with a solntion of hyposulphite of soda, and precipitating the silver from its solntion as a sulphide by means of five-fold sulphide of sodium. The sulphide of silver ohtained is put into a muffle, where it is exposed to a glowing temperature and a current of air, so that the sulphur is almost entirely burnt ont, leaving a metallic sponge. Ths product is smelted, with the addition of a small quantity of iron to carry away the snlphur that may yet remain, and thus a silver of 980 to 985 thousandths of fineness is produced. An important saving in the amount of fuel and lahor is secured by this process; and for these reasons the plan is worthy of the consideration of those engaged in reducing silver ores on the Pacific coast, where both fuel nnd lahor are dear.

[To be Continued.]

In Memoniam.—Many of the counties in the Eastern States are erecting monuments in memory of their soldier heroes who fell in the late war of rebellion. There are some who object to county memorials, holding that each town should do honor to its own gallant dead. Gratitude for the services of those who have died in this terrible struggle shonld be expressed without stint. A regard for the opinion of future generations demands that this should be done. What does California propose to do for *her* gallant dead?

Blockade of the Chilean Ports.—By the arrival of the British ship Gentoo we have confirmation of the reported blockade of the port of Valparaiso, that vessel having endeavored for two days to enter, and, after communicating with the shore, was ordered to proceed to San Francisco.

Lake Superior Copper—Six hnndred tons of rock were stamped at the Albany and Boston Stamp Mill, Lake Superior, during the month of September last. Taking the amouot of copper reported, the percentage yield of this ore would be 2.67. The yield, however, was native copper.

Oil at Lake Superior.—An experienced oil well borer is now employed, with the necessary apparatus, in boring lor oil in the sandrock of the Ontonagon mining district, Lake Superior. It is said there are strong indications of petroleum in that region.

Sugar Mill.—A man named Phillips, of Rice Creek, Butte county, says the Chico *Courant*, is an enterprising farmer, and owns the only sugar mill in that part of the State, manufacturing each year a large quantity of sorghum syrup, from cane of his own raising.

Rich Claim Lost.—Recently a company of Irishmen struck a rich claim in the bank of a creek near Lower Calaveras, in Calaveras county, from which they took quite an amount of gold. They went on a spree for several days, when some Italians jumped their claim and are now working it.

GOLD MINING IN AUSTRALIA.

The Miners Employed in 1865.—Dnring the year 1862 there were employed in the Australian gold fields an average number of 97,942 miners, the produce of whose lahor was 1,702,460 ounces, equal to $30,000,000. This makee the average weekly earnings of each miner within a fraction of $5. In 1863 the average number of miners employed was 92,292, who prodoced 1,578,079 ounces, equal to $29,405,422. During the year 1864 the average number of miners employed was 83,394, who obtaioed, as the result of their lahors, 1,557,397 ounces of gold. During the first half of the present year the number of men engaged was 85,022. They produced 756,435 ounces of gold. These results, it will he seeu, are quite uniform for the past three or four years.

The first six months of the pre ent year, more especially the latter half of that period, was a trying time for the miners. The long continued drought exercised a most prejndicial influence. At many of the newly opened fields, especially, numhers of men were idle from want of water, the working of the machines were suspended, and the yield of gold was very sensibly effected. Under these circumstaoces a very serioos deficiency was expected in the amount of gold produced doring the period referred to. That this has not been the case speaks well for the wealth and permnnency of the auriferous resources of Australia.

A Hundred weight of Gold.—The window of the Oriental Bank recently contained a cake of amalgamated gold, weighing 1,312 ounces, or within a trifle of a hundred weight. The cake was from the celebrated claim of Latham & Watson, on the Hnsller's Reef. As may he imagined, the monster cake was the "cynosure of all eyes," and the windows of the other banks, although containing many a goodly-sized cake, were deserted for inspection of the monster cake. This is thought to be the largest cake ever produced, and was the result of a crushing of about 300 tons of quartz—nearly 4½ ounces to the ton.

A Lucky Speculator.—A striking instance of the uncertainty of mining recently occurred at Whroo, in the Rushworth district. A poor miner, who had been working in alluvial ground for a long time, and was harely earning a livelihood, accidentally came on a reef with gold-bearing indications. He was so destitute of means that he was unable to raise £1 for a miner's right to secure his title to the claim, and he solicited several persons, to whom he related his discovery, for the money, at the same time offering a half share in the claim for the advance. He was met with a refusal by all except one, who gave the money as a hazardous speculation, but was amply repaid by the first crushing, which gave a dividend of nearly £500 to each man.

On Tuesday, July 17th, a piece of quartz, taken from Williams & Co.'s claim, on the North Catherine Reef, was exhibited at the branch office of the Bank of Victoria, Eaglehawk, which for richness has scarcely ever been exceeded on Bendigo. The block of quartz (which is about 1½ foot square) shows large lumps of gold, varying in size from a pea to a walout, on every portion of its face, the interior of the stone, probably, containing gold in as great proportions.

The Miners' Strikes in the Pennsylvania coal regions have assisted materially in adding to the profits of the owners of coal mines, besides creating an active speculative demand for coal companies' stocks, and for the shares of railroads leading into the coal regions. The Reading Railroad Company have reaped the richest harvest from this condition of affairs, having been enabled to realize an income of over a quarter of a million dollars per week from the coal tonnage alone.

Of course the miners of Pennsylvania "strike" with their picks. Such "strikes" are generally far more profitable to all parties than a "strike" without picks.

A Mr. Mitchell, an old prospector, is realizing $72 per ton, *with an arastra*, from stuff out of the Granite Mountain Lode, near Diamond City, Montana. Flour fetches $25 per hundred, at this mining camp or "city."

THE CALIFORNIA ACADEMY OF NATURAL SCIENCES.

We have received a copy of the proceedings of this society, from February to September of the present year, from which we make the following extracts:

NEW MINERAL OIL REGIONS IN THE TULARE VALLEY—BY WILLIAM P. BLAKE.

Recent examinations of prospecting parties, have added largely to the well-known oil-bearing portions of the State. A district some sixty miles in length, on the inner slopes of the Coast mountains, towards the Tulare Valley, has been found to abound in oil springs, or indications of oil. Oil exudes from the surface in large quantities, and collects rapidly in small pits sunk by prospectors. The soil about these pits is very black and saturated with oil. The gases escaping from this soil are inflammable, and many of the prospectors have been startled to see flames spreading over the ground, beyond their camp fires. In digging pits about these springs, large quantities of bones of various kinds have been thrown out, and all are wonderfully well preserved. These bones appear chiefly those of the horse, deer, and elk, though there are many others which I have not been able to recognize. The teeth of the horse, sent to me, are of unusual size, and induce the question, whether they are not of greater antiquity than the present race of horses. I am assured that the variety of bones and teeth of many kinds is very great.

The oil found gives an excellent article for lubricating purposes, and must be very similar to the oil found near Zanesville, Ohio, according to the descriptions given of the latter.

THE OCCURRENCE OF SPHENE IN THE GRANITE OF THE SIERRA NEVADA.

Sphene, in small hair-brown or amber-colored crystals, appears to be abundantly distributed in the granite of the Sierra Nevada. It may be found at the sources of the American river, in the exposures of granite about Slippery Ford, and other points, and upon the Mokelumne river, further south. The crystals are seldom more than the thirty-second part of an inch in diameter, and are not conspicuous, but may be found in almost any specimen of the rocks.

It appears that this mineral is also of common occurrence in the granite of the British Islands. In a report to the British Association (1863), upon the composition of the granite of Donegal, it is stated, that the rock contains, almost universally, small crystals of sphene, in some varieties so abundantly as to induce the authors of the Report to term it "sphene granite." It is also observed that this mineral has long been known to exist in the granite of parts of Scotland, and in that of Galway.

Sphene is described by Dana as a mineral composed of silicic acid, titanic acid, and lime. Its colors are dull yellow, green, gray, brown and black. It is found both amorphous and in crystals. Its formula is usually very nearly $35\ SiO_3$; $33\ TiO_2$; $33\ CaO$.

At the session of July 3d, some interesting remarks were made by Mr. Kennicott and Dr. Behr, upon the relation of the Esquimaux to the North American Indians. Dr. Behr said:

The Esqnimaux can only be considered as a kind of Indian race, their language being of the same structure, and their different habits were due to physical influences. He further stated that the Esquimaux formerly lived farther south. Mr. Kennicott remarked, that from his observations, and information derived from Madam Roshkin, and from Tsagashin's report, he believed the natives, for some hundreds of miles up the Kvichpak or Yonkon river, were Esquimaux rather than Indians.

At the session of September 4th, Professor Blake presented the following note—

ON THE ABUNDANCE OF IRON ORE IN NORTHERN ARIZONA.

In 1863 I observed an iron formation of considerable extent and interest upon and near the William's Fork of the Colorado, near its mouth. The ore is chiefly the micaceous variety of Hematite, or "specular iron," and occurs in thick beds and in thin sheets, in a ferruginous limestone or dolomite, evidently metamorphic, and tilted up at a high angle.

It forms a belt of peculiar appearance, that may be traced by the eye for miles across the country, in a direction a few degrees south of west. This rock and iron ore is inter-stratified with chloritic and talcose slates and granite, and the series also bears copper ores and gold.

From the collections made by Lieut. Whipple's party, in 1853, in the mountaine north, it would appear that similar rocks exist in the Cerbat and Aquarius Mountains, the extreme geological antiquity of which was commented on by me in the Pacific R. R. Reports, Vol. III, p. 59. It is possible that this ferriferous formation is connected with the extensive iron formation of the coast of Mexico, south of Acapulco, described by Mr. Manross, (Am. Journ. Sci., XXXIX, 358,) and it may be of pre-Silurian date.

Useful Information.

The Philosophy of Sleep.

NUMBER THREE.

INFLUENCES WHICH PROMOTE OR PREVENT SLEEP.

The best preparation for sleep is sixteen to eighteen hours of varied mental and bodily occupation, enough to tire, not to exhaust; the mind not having been over-excited, the body not over fatigued, and the spirits at the close equable, or if out of moderation, rather depressed than exhilarated.

It is told of Napoleon, that he could, at any time, compose himself to sleep at will. The fact seems wonderful, but, if true, it is no wonder. The mind and body, in such a case, constantly used to the utmost, would constantly be in need of repose. If we imagine, in such a case, a consciousness of talent equal to any emergency, combined with perfect physical and moral courage, and a clear view of all the contingencies of the hour, the question is not, what should enable, but what is to prevent, a soldier dropping asleep at the first convenient opportunity.

The mind has more to do with the prevention of sleep than the body. Different persons, however, take different views of what is mentally composing. Dr. Macnish observes, "a person would more readily fall asleep, listening to a profound piece of argumentation, than to a humorous and fanciful story; and probably more have slumbered over the pages of Bacon and Locke than over those of Shakespeare and Milton." I confess that I feel disposed to reverse the terms of the antithesis, being in the habit of taking refuge in a poem, or a novel, from the state of full mental waking which I find reflection produce.

Dugald Stewart remarks, "It is well known that there is a particular class of sounds which compose to sleep. The hum of bees, the murmur of a fountain, the reading of an uninteresting discourse, have this tendency in a remarkable degree. If we examine this class of sounds, we shall find that it consists wholly of such as are fitted to withdraw the attention of the mind from our own thoughts, and are at the same time not sufficiently interesting to engage its attention to themselves."

It is found that heat produces two contrary effects in respect to sleep; it disposes us to sleep in the day-time, but interrupts sleep at night. In the day-time it oppresses, relaxes, weakens; at night it stimulates. In hot weather, the entire quantity of sleep taken is less than in cold weather. On a change of weather in winter, one is sometimes kept awake, till he remembers that the clothes on his bed are too warm for the thaw which has succeeded.

COLD PROMOTES SLEEP.

In the winter we sleep more than in summer. This arises from two causes; our habits are of more active exertion in winter, which exhausts; and the cold itself, by requiring a larger supply of heat from us, likewise consumes our strength, not to mention the disinclination to leave the pleasant repose of our beds, during which sleep again overtakes us.

Nature, if I may be allowed the expression, has stepped out of her path to give this element of animal nature, namely, the relation of sleep to cold, development. Many animals hybernate, or fall into a winter sleep, during which they take no nutriment, but remain torpid, their breathing and circulation being extremely languid, and their nourishment turning upon the absorption of their summer fat. In these animals, the temperature falls during hybernation, to obviate the effect of which, they ensconce themselves under shelter, and many of them accumulate materials around them, to exclude the cold. It is singular that exposure to intense cold weakens a hybernating animal. For cold as a mortal agent, destroys by producing "sleep that knows no waking." The hybernating animal is first awakened by cold, then sinks under its influence into a new sleep, and dies.

DANGER OF SLEEP IN THE PRESENCE OF INTENSE COLD.

In Captain Cook's first voyage, the effects of cold inducing this sleep are strikingly instanced. The scene occurred in the island of Terra del-Fuego.—Dr. Solander, Mr. Banks, and several other gentlemen, had ascended the mountains of that cold region for the purpose of botanizing and exploring the country. "Dr. Solander, who had more than once crossed the mountains which divide Sweden from Norway, well knew that extreme cold, especially when joined with fatigue, produces a torpor and sleepiness that are almost irresistible. He, therefore, conjured the company to keep moving, whatever relief they might be promised by an inclination to rest. 'Whoever sits down,' said he, 'will sleep; and whoever sleeps, will wake no more.' Thus at once admonished and alarmed, they set forward; but while they were still upon the naked rock, and before they had got among the bushes, the cold became suddenly so intense, as to produce the effects that had been most dreaded. Dr. Solander himself was the first who felt the inclination, against which he had warned others, irresistible; and insisted upon being suffered to lie down. Mr. Banks entreated and remonstrated in vain; down he lay upon the ground, although he was covered with snow, and it was with great difficulty that his friend kept him from sleeping. Richmond, also, one of the black servants, began to finger, having suffered from the cold in the same manner as the doctor. Mr. Banks, therefore, sent five of the company, among whom was Mr. Buchan, forward, to get a fire ready at the first convenient place they could find; and himself, with four others, remained with the doctor and Richmond, whom, partly by persuasion and entreaty, and partly by force, they brought on; but when they had got through the greatest part of the birch and swamp, they both declared they could go no further. Mr. Banks again had resource to entreaty and expostulation, but they produced no effect. When Richmond was told that if he did not go on he would in a short time be frozen to death, he answered that he desired nothing but to lie down and die. The doctor did not so explicitly renounce his life; he said that he was willing to go on, but that he must first take some sleep, though he had before told the company to sleep was to perish. Mr. Banks and the rest found it impossible to carry them; and there being no remedy, they were both suffered to sit down, being partly supported by the bushes; and in a few minutes they fell into a profound sleep. Soon after, some of the people who had been sent forward, returned, with the welcome news that a fire was kindled about a quarter of a mile farther on the way. Mr. Banks then endeavored to awake Dr. Solander, and happily succeeded. But though he had not slept five minutes, he had almost lost the use of his limbs, and the muscles were so shrunk, that the shoes fell from his feet; he consented to go forward with such assistance as could be given him, but no attempts to relieve poor Richmond were successful."

[To be Continued.]

What is Saleratus.—Wood is burnt to ashes, are lixivated, ley is the result. Ley is evaporated by boiling, black salts is the residium. The salt undergoes purification by fire, and the potash of commerce is obtained. By another process, we change potash into pearlash. Now put these in sacks and place them over a distillery wash tub, where the fermentation evolves carbonic acid gas, and the pearlash absorbs it and is rendered solid; the product being heavier, whiter, and drier, than the pearlash. It is now saleratus. How much salts of ley and carbonic acid gas a human stomach can bear and remain healthy is a question for a saleratus eater. Some people say saleratus will not hurm the stomach. It is a *ley*.

M. Jeannel has discovered a new way of easily ascertaining whether there exists any lead in the tin used for tinning culinary vessels in hospitals. His method consists in this:—Take about five decigrams of scrapings of the metal to be tested, and boil it in an excess of nitric acid diluted with one-third of its weight of water. When the solution is complete, filter and then put in a crystal of iodide of potassium. If the liquid contains but a ten-thousandth part of lead, a yellow precipitate will be formed, which will not disappear by the addition of an excess of ammonia.

A Tremendous Idea.—A member of the Academie des Sciences of Paris, who is also an eminent chemist, has invented an apparatus which he thinks will enable human beings to breathe as freely at the bottom of the sea as on the surface of the earth. He proposes to form an association for collecting all the treasures now lying at the bottom of the ocean, and estimates at about £800,000,000 sterling the harvest of treasure to be gleaned on the route between England and India only.

Worthy Sons of a Worthy Sire.—It is related, as a pleasing instance of the transmission of noble qualities from father to son that the two younger sons of the late Horace Mann, upon the loss by their brother of his property in the Concord Bank through the recent robbery, at once informed him "that one-third of their joint bequest should be his."

It is said that when a Frenchman has to wait, he smokes; a German meditates; an Italian sleeps; an Englishman walks; but an American swears, invents some contortion of the limbs, and tries to put his feet up higher than ever.

The Circulation of Sap in Trees, and the Formation of Wood.

Trees are made up of fine tubes which extend from the root to the leaf, and it is through these tubes that the circulation of the sap is carried on. If a growing tree is pulled up by the roots, and the roots are placed in a vessel of water containing some colored solution which they will absorb, we can trace the course of this colored solution through the tree by cutting notches into it at successive periods. The coloring matter is always found first in the body of the wood near the root, then in the wood higher up, and so on until it reaches the leaf; then it begins to appear in the inner bark near the leaf, and it passes down through the bark again to the root. This observation shows that the circulation of the sap is up through the wood, and down through the bark.

There has been much speculation in relation to the force that causes the sap of plants to circulate, but it has never been settled by observation and experiment. It is pretty well established that sap circulates in the winter, though less rapidly than in the summer, and less rapidly at that time in deciduous than in evergreen trees.

The solid portions of thoroughly dried wood, and other parts of plants, are composed mainly of water and charcoal. When charcoal is burned, a small portion of ash is left. This ash is the mineral or inorganic portion of the substance of the tree, and consists principally of potash, lime, and flint, or silex. That portion which burns is carbon. In burning, the carbon unites with oxygen, to form carbonic acid, an invisible gas that floats away in the atmosphere.

The water and the inorganic matters enter the tree through the roots; the carbon enters mostly through the leaves. Carbon forms about one-half of the solid substance of the tree, and water the other half.

Water is composed of two elements, oxygen and hydrogen, in the proportion of eight pounds of oxygen to one of hydrogen. These in entering into a chemical combination with carbon, lose the liquid state of water, and form the various solid substances which make up the body of the tree.

In its course the sap undergoes important transformations. The trunks and leaves of trees are scenes of constant chemical operations, many of them more mysterious than any of the operations of the laboratory. One of these is the decomposition of carbonic acid in the leaf. The affinity of carbon and oxygen is very strong indeed, and there are few forces in Nature that can rend these two elements asunder; but the combined action of light and vegetable life is separating them throughout every day in the leaves of all growing plants. Carbonic acid is absorbed from the atmosphere by the leaf, its two elements are torn apart, the oxygen is returned to the air, and the carbon combining chemically with other elements in the sap, is carried to the places where new wood is being formed, and is there deposited in its proper place to help build up the structure of the tree. The symmetrical order in which the carbon is deposited in a tree may be seen by looking at a piece of charcoal.

If wood is examined under a powerful microscope, it is found that the tubes through which the sap circulates are formed of minute sacs or cells. The substance of which the walls of these cells are formed is called cellulose. It has been the subject of a great deal of chemical research, and is found to consist of carbon and water, or more strictly, of carbon and the elements of water, oxygen, and hydrogen. Cotton and linen are almost pure cellulose. Each atom of cellulose contains twelve atoms of carbon, ten atoms of hydrogen, and ten of oxygen, $C_{12}\ H_{10}\ O_{10}$. Starch, gum and sugar all have the same composition, $C_{12}\ H_{10}\ O_{10}$. This is one of the wonders of chemistry, that substances composed of the same elements, combined in the same proportion, should have properties so different as gum, starch, sugar, and cotton or linen fibre. Their different properties must of course result from the varied modes in which the atoms are arranged.

Besides these four substances there is one other constituting a considerable portion of the body of trees, which is also formed of the same elements as the others, but in slightly different proportions. This is lignin. It is an incrustation on the inner surfaces of the cell walls, and its office appears to be to strengthen and stiffen these walls. Its constitution is $C_{12}\ H_8\ O_8$. In this case, as in the others, there are just as many atoms of hydrogen as of oxygen; these two elements enter into the compound in the same proportion to each other as that in which they unite to form water. If a tree or other plant is thoroughly dried so as to expel all of its uncombined water, nine-tenths of the remaining substance consists of the two compounds, cellulose, lignin, starch, gum, and sugar, and all of these are composed of hydrogen and oxygen in the same relative proportion as that in which they exist in water, chemically combined with carbon.

Why it is that the atoms of these substances are so arranged in one part of the plant to form cellulose, and in another to form starch; why it is that they are so arranged in one tree as to form gum, and in another to form sugar, are mysteries which lie beyond the present boundaries of human knowledge.

There is one other organic element, and several inorganic, besides those mentioned, which enter, though in small quantities, into the constitution of plants, but a full discussion of the part which they perform in vegetable economy would demand an exhaustive treatise on agricultural chemistry and vegetable physiology.

The Cannon Fever.

The celebrated German poet Goethe was present as a spectator at the battle of Valmy, in 1792, between the armies of the French Republic, under Dumourier and Kellerman, and the allied armies under the Duke of Brunswick, and gives his first impressions of an artillery battle as follows:

"I had heard so much of the "cannon fever," that I wanted to know what kind of a thing it was. Ennui, and a spirit which every kind of danger excites to daring—nay, even to rashness, induced me to ride up quite coolly to the out-work of La Lune. This was again occupied by our people, but it presented the wildest aspect. The roofs were shot to pieces, the corn shocks scattered about, the bodies of men, mortally wounded, stretched upon them here and there, and occasionally a spent cannon ball fell and rattled among the tiled roofs. Quite alone, and left to myself, I rode away to the heights on the left, and could plainly survey the favorable position of the French. They were standing in the form of a semi-circle, in the greatest quiet and security—Kellerman, then on the left wing, being the easiest to reach.

I fell in with good company on the way—officers of my acquaintance belonging to the general staff and the regiment, who were greatly surprised to find me here. They wanted to take me up again with them, but I spoke to them of particular objects I had in view, and they left me without further discussion to my well known singular caprice. I had now arrived quite in the region where the balls were playing across me; the sound of them is curious enough, as if it were composed of the humming of tops, the gargling of water, and the whistling of birds. They were less dangerous by reason of the wetness of the ground—whenever one fell it stuck fast—and thus my foolish experimental ride was secured against the danger at least of the balls rebounding. In the midst of these circumstances, I was soon able to remark that something unusual was taking place within me. I paid close attention to it, and still the sensation can only be described by similitude. It appeared as if you were in some extremely hot place, and at the time quite penetrated by the heat of it, so that you feel yourself, as it were, quite one with the element in which you are. The eyes lose nothing of their strength or clearness, but it is as if the world had a kind of brown-red tint, which makes the situation as well as the surrounding objects more impressive.

I was unable to perceive any agitation of the blood; but everything seemed rather to be swallowed up in the glow of which I speak. From this, then, it is clear in what sense this condition can be called a fever. It is remarkable, however, that the horrible, uneasy feeling arising from it is produced in us sorely through the ears; for the cannon thunder, the howling and crashing of balls through the air, is the real cause of these sensations. After I had ridden back, and was in perfect security, I remarked with surprise that the glow was completely extinguished, and not the slightest feverish agitation was left behind. On the whole, the condition is one of the least enviable; as, indeed, among my dear and noble comrades, I found scarcely one who expressed a really passionate desire to try it.

The Unbroken Mines.—The Nevada *Transcript* says: Eastern people who form their ideas of our mines from the San Francisco quotations, would conclude that the mines of the entire coast were giving out; but in reality quartz mining is just taking a new start, and the prospects are more flattering now than they have been for many years. Few of the paying quartz mines, however, are incorporated, consequently they are not heard of at the Stock Board.

Quartz Mills in the Boise Basin.—The Chickahominy mill at Idaho City, is about ready to commence crushing ore. There are two mills at the head of Grimes' Creek at work, which run fifteen stamps. There is one mill of five stamps on the Elkhorn Lode; two on the Illinois, twenty stamps; one on the Landon, five stamps. The quartz prospects of the basin are very encouraging, says the Dalles *Mountaineer*.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, December 2d, 1865.

The money market presents no new feature. A fair degree of activity prevails, and the current rate in bank is 1¼@1½ ₱ cent. per month, with occasional transactions upon more favorable terms to the borrower. Negotiations of the latter character are, however, in most instances made by the different Insurance companies and Savings Fund societies. In the open market 1½@2½ ₱ cent. per month is still paid.

Receipts of treasure from domestic sources, since our last reference, amounted to some $950,000, making an aggregate of $4,350,000 during the month of November.

Bullion was in fair request early in the week, and gold bars were sold at 850, but since the sailing of the Panama steamer the prevailing rate has been 830@840. Silver is a shade higher, and bars of average fineness command ½ ₱ cent premium.

Article 35 of the By-Laws of the Stock and Exchange Board has been amended as follows:

Penalty for doing Business for less than the Regular Commission.

"The Commission for purchase and sale of stock shall be as named in the Constitution, and any member violating this rule shall, on due conviction, be EXPELLED from the Board.

"All excise taxes upon the sale of stocks shall be paid by the Broker.

"It is hereby fully and distinctly understood, that the commissions hereafter to be charged, shall be upon all purchases and upon all sales; and that the full amount shall be charged, and no less sum received, except the principal or customer be a legitimate stock broker, not residing in this State."

Dullness and depression have been characteristic features of the Share Market this week, and transactions at the Board were of less importance than for some time past. There is little or no improvement to note, and some stocks are even lower than at the close of last week. Nevada advices are devoid of special interest, but so far as we can learn the work of development is progressing with unusual vigor, and a large amount of ore will be extracted the current month.

City Stocks, for the most part, are well maintained. Spring Valley Water was sold at $55½, and closes at $55½ asked. This company have been employing, for some time past, some 300 laborers upon their new dam at Pillarcitos Creek, and the entire work is to be completed in about ten days. The aggregate earnings of the company have exceeded $80,000 during the past 60 days, and the usual dividend will be paid on the 10th inst. North Beach and Mission R. R. was sold at $44, and Fireman's Fund Insurance Co. at $130. California Steam Navigation fell from $69 to $60, seller 60, then sold at 63, and closed at 64 asked.

Gould & Curry is in rather better favor, and small sales were made within a range of $950, seller 30, and $1,000, buyer $30. Explorations in the lower portion of the mine continue to be prosecuted with vigor, and the upper works have disclosed recently larger bodies of ore than were thought to exist there. The financial affairs of the company are slowly but steadily improving, and the yield of bullion last month amounted to $185,000.

Alpha rose from $860 to $900, buyer 30, dropped to $825, rallied to $850, steadily declined to $660, then sold at $750@$720, and closed yesterday at $740. At these rates some 70 feet were sold. The appearance of the lower level is said to be less flattering than was anticipated.

Savage steadily declined from $735 to $660, and sold yesterday at $670. The Minnesota and other mills are now reducing some 150 tons of ore per day, averaging $40 per ton. It is proper to state that the exhibit made last week of the financial condition of this company, embraced the pay roll of the past month, and all other liabilities due in Nevada and elsewhere.

Yellow Jacket was dealt in to the extent of 130 feet, steadily declining from $625 to $540, and selling at the first Board yesterday at $525. We are not in receipt of the usual returns from this mine for the past two weeks, but learn that in the north end of the lower level a body of ore some 25 feet wide has been disclosed, and in the southwest drift, same level, a deposit of ore 15 feet wide has been met with. The Morgan mill is now reducing 85@90 tons of ore per day.

Crown Point fell from $775 to $675, and sold yesterday morning at $700. During the week ending November 25th, 275 tons of ore were extracted, and a reserve of some 500 tons are now on hand. The drift on the lower level 120 feet from the shaft, has passed through a lode of quartz containing some good ore, and the middle and west strata will be reached as soon as practicable. The north incline from the 230-feet level is now down 63 feet in good ore, and is said to look better than ever. The south drift is down 69 feet, in fair ore at the bottom, and the incline on the east stratum also shows some improvement.

Belcher was dealt in within a range of $260 and $340, closing at $265.

Ophir was dealt in at $385@$365, and sold yesterday morning at $365. Receipts of bullion during the month of November, amounted to $55,000. We are informed that in the 4th gallery of the south mine, near the line of the Central, a considerable body of ore has been found in virgin ground.

Chollar-Potosi has been very active, and some 470 feet were sold, receding from $287½ to $252, rallying to $265, and closing at the first Board yesterday at $250. During the week ending November 24th, 352 tons of ore were sent to custom mills, and some 800 tons sold at $10, $8, $6 and $5 per ton. From the Grass Roots station 30 tons per day are now taken, and enough is said to be in sight to keep up this supply for some time to come. The Grass Valley station (Chollar mine) is looking well and turning out considerable ore. Ore has also been found between that station and the second level of the Chollar. From the 3d and 4th levels of the latter about 20 tons are now taken daily.

Hale & Norcross was sold at $205@$200, and closed at $150 bid. Empire Mill fell from $175 to $165, and is now held at $170. From the new development in the upper works some 50 tons of fair ore is now taken daily.

Imperial fell from $129 to $116, rallied to $128, fell to $116, seller 30, rose to $122, and sold yesterday morning at $120@$122—some 1,700 shares in all changing hands. The third clean-up is said to be unfavorable, and the aggregate receipts for the past month will, probably, not be up to the average of the past few months.

Bullion has been sold within a range of $40@$33, closing at $35. Overman fell from $45 to $39, rallied to $43, and sold yesterday morning at $43. Sierra Nevada was dealt in at $5@$7, closing at $6.

The aggregate sales of Stocks, since Saturday last inclusive, amounted to $717,506.
